**Audit Notes**

The IR videos in the folder (1041, 1042, 1043) do not correspond to IR verification PDF (1038, 1039, 1040). However, site names at the end of the mp4 matched the name of the site.

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **JOHNSON MARK ALTER AMANDA ZANE T4N-R64W-S9 L01**

Consent Decree Tank System Number: **652**

**Audit Notes**

The walkdown checklist (JOHNSON MARK ALTER AMANDA ZANE T4N-R64W-S9 L01\_WALKDOWN) was not marked as being complete. Completion was verified through other documentation in the final packet (JOHNSON MARK ALTER AMANDA ZANE T4N-R64W-S9 L01\_FINAL PACKET).

According to the field datasheet (JOHNSON MARK ALTER AMANDA ZANE T4N-R64W-S9 L01\_FINAL PACKET, p 15) the 300 bbl water tanks is not connected to the VOC system. This contradicts both the model (JOHNSON MARK ALTER AMANDA ZANE T4N-R64W-S9 L01\_STEM Engineering Evaluation\_rev1\_with TLO), the signed eval (JOHNSON MARK ALTER AMANDA ZANE T4N-R64W-S9 L01\_SIGNED EVAL), and the job sheet (JOHNSON MARK ALTER AMANDA ZANE T4N-R64W-S9 L01\_FINAL PACKET, p 22). The modeling guideline is still strictly followed because the PPIVF is either overestimated or accurately estimated.

As per the field data sheet (JOHNSON MARK ALTER AMANDA ZANE T4N-R64W-S9 L01\_FINAL PACKET, p 17), there are 3 different combustors on site, a Tornado, Cimarron 48", and Cimarron 48" HV. The model accounts for the two Cimarron combustors both as just Cimarron 48" HV's (JOHNSON MARK ALTER AMANDA ZANE T4N-R64W-S9 L01\_STEM Engineering Evaluation\_rev1\_with TLO) . A new model was created to showcase these changes (JOHNSON MARK ALTER AMANDA ZANE T4N-R64W-S9 L01\_STEM E\_Eval\_rev2\_RA\_TLO). The data request response from 8/15/2018 stated "There are 3 burners located at the facility, one Tornado and two Cimarrons 48 HVs. This is consistent with the engineering evaluation. Field verification for this facility was completed on or around 9/2/16, field verification for this facility confirmed that there are three burners on site." This confirms that the two Cimarron burners on site are 48" HVs.

The water dump valve on the HP separator associated with the MARK ALTER C16-79HN well is 2" in size according to the field datasheets (JOHNSON MARK ALTER AMANDA ZANE T4N-R64W-S9 L01\_FINAL PACKET, p 16). The STEM engineering evaluation (JOHNSON MARK ALTER AMANDA ZANE T4N-R64W-S9 L01\_STEM Engineering Evaluation\_rev1\_with TLO) was completed with this separator having a 1" water dump valve. The work request and job sheets do not request to reduce the size of the water dump valve on this separator. As a result water flash gas and working losses are underestimated and the modeling guideline was not strictly applied.

LOD ID: **JONES T7N-R63W-S5 L01**

Consent Decree Tank System Number: **2004**

**Audit Notes**

The Work Request indicated the oil and water dump valves on Separators 1 & 2 were to be modified to 1/2 inch trims. The oil and water dump valves were indicated at 2" valves for all. Evaluation was completed with a 1" oil valve on the LP Separator. Could not verify the oil dump valve size (2" or 1") on the LP separator with the documentation provided. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim.

It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

An initial Work Request dated 10/18/2016, requested a single tank be disconnected from the fill header and utilized as a headspace only tank. The accompanying Job Sheet, dated 3/3/17, did not confirm the requested modification was completed. The Walkdown Checklist, dated 4/4/17, item C13 indicated the LP Separator could produce to all tanks. A second Work Request, issued 3/14/18, requested another tank be disconnected from the fill header and utilized as a headspace only tank. There is no accompanying Job Sheet for this request. The assumed (non-dated) Walkdown Checklist for the second Work Request had item C14, "Are tank fill lines configured to enable LP Separator(s) to produce into all tanks?", marked as NA. Information initially provided does not confirm two tanks were disconnected from fill to be used as headspace tanks only.

Noble provided information on 11/14/2018 indicating "Rework was completed on or around 4/11/2018, in the final packet, JONES T7N-R63W-S5 L01\_FINAL PACKET, submitted with the File Delivery May 22, 2018, pages 31-34 include documentation of the completed rework, specifically the signatures and completed walkdown provide documentation that the second work request was completed and that the second headspace tank was created." The signatures on page 31 of the JONES T7N-R63W-S5 L01\_FINAL PACKET do not have further description as to what they signify (issuance or the work order, completion of the work order, etc.) and the walkdown checklist does not specifically address headspace tanks. Additional information was provided in a letter date 3/27/2020 in which Noble stated "The number of headspace tanks was field verified on April 23, 2019."

LOD ID: **JONES T7N-R63W-S6 L01**

Consent Decree Tank System Number: **1993**

**Audit Notes**

A Work Order request was issued to "bottom out" one oil tank; remove the oil fill line from the tank while keeping the tank connected to the VCS in order to be utilized as head space only. The accompanying Job Sheet did not confirm the tank was "bottomed out" and the Walkdown Checklist was not checked as complete to "Confirm all the items on the work request form have been completed." Additionally, the provided STEM Retrofit Walkdown Checklist, Item C13, was checked "NA" making it indeterminate whether the LP separator could produce into all tanks.

Noble provided information on 12/10/2018 indicating a "Field verification for this facility was completed on or around 6/23/2016, field verification confirmed that one tank was converted to a headspace tank." The Engineering Design Standard has been appropriately applied based on the provided field verification information.

**Audit Notes**

The Walk down checklist not marked as being completed. The site was verified through other supplied documentation. (KANGA STATE T3N-R64W-S36 L01\_WALKDOWN pg. 4 )

Per the Work Request (KANGA STATE T3N-R64W-S36 L01\_FINAL PACKET.pdf, pg. 3) existing LP oil dump valve and trim should be replaced with a 1" valve and 1/2" trim. The Job Sheet (KANGA STATE T3N-R64W-S36 L01\_FINAL PACKET.pdf, pg 19) confirms trim and valve were installed, but the sizes were not verified. The walkdown checklist (KANGA STATE T3N-R64W-S36 L01\_WALKDOWN,p 1) item A1 confirms the trim sizes (1/2") on the signed eval (FOSS T6N-R63W-S6 L02\_SIGNED EVAL, p 2) are correct. There was no confirmation that the valve size was changed from the original 2" size. A 2" valve was used in these calculations to be conservative. It is unknown if the modeling guideline was strictly followed for the tank system.

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

This site was selected for an additional IR camera inspection to inspect a possible leak along the VCS line.

LOD ID: **KARAKAKES T3N-R65W-S13 L02**

Consent Decree Tank System Number: **2009**

**Audit Notes**

Modeling was completed with one tank utilized as headspace, removed from liquid service. The signed evaluation utilizes a 60% Certification Max (one tank in vapor service, three tanks 80% full), while the STEM model used a 68% max (one tank in vapor service, three tanks 90% full). Need to verify whether the tanks are operated at 60% or 68% liquid level.

STEM modeling file used 400 psig maximum operating pressure on the HP separator. The signed evaluation utilized a 500 psig maximum operating pressure for the HP Separator. Need to verify the correct maximum operating pressure to correctly determine the water dump impact.

Noble Response- 'The Engineering Evaluation has been updated to reflect that the tanks are operating at 68% liquid level. As such, the Engineering Evaluation submitted with File Delivery Oct 31, 2017 has been updated and is being provided with this 3rd Request Response as documents: (1) 104-105\_KARAKAKES T3N-R65W-S13 L02\_Final Signed STEM Plan2 , (2) 104-105\_KARAKAKES T3N-R65W-S13 L02\_SIGNED EVAL\_rev , and (3) 104-105\_KARAKAKES T3N-R65W-S13 L02\_STEM Engineering Evaluation\_rev1\_with TLO\_correction.

Noble Response- 'The Signed Engineering Evaluation has been updated to reflect that the separator pressure is designed at 400 psig. As such, the Engineering Evaluation submitted with File Delivery Oct 31, 2017 has been updated and is being provided with this 3rd Request Response as documents: (1) 104-105\_KARAKAKES T3N-R65W-S13 L02\_Final Signed STEM Plan2, (2) 104-105\_KARAKAKES T3N-R65W-S13 L02\_SIGNED EVAL\_rev, and (3) 104-105\_KARAKAKES T3N-R65W-S13 L02\_STEM Engineering Evaluation\_rev1\_with TLO\_correction.

Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **KARCH BLUE GUTTERSEN T3N-R64W-S12 L01**

Consent Decree Tank System Number: **541**

**Audit Notes**

A Work Order request was issued to "bottom out" one oil tank; remove the oil fill line from the tank while keeping the tank connected to the VCS in order to be utilized as head space only. The accompanying Job Sheet did not confirm the tank was "bottomed out" and the Walkdown Checklist was not checked as complete to "Confirm all the items on the work request form have been completed." Additionally, the provided STEM Retrofit Walkdown Checklist, Item C13, was checked "NA" making it ambiguous as to whether the tank was placed in vapor headspace use.

NEI Data Request Respose:

Field verification for this facility was completed on or around 5/24/16, field verification confirmed that one tank was converted into a headspace tank (i.e. removed from liquid service but remained connected to vapor header).

The Work Request indicated the oil dump valve on HLP Separator was to be modified to Kimray 1400 with 1/2 inch trims. Could not verify the oil dump valve size (2" or 1") on the separator with the documentation provided. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim.

It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

LOD ID: **KATE WHITE JESSIE T3N-R64W-S29 L01**

Consent Decree Tank System Number: **1120**

**Audit Notes**

The separator on location has pressure controlled by a pneumatic controller. The provided documentation shows that the controller shut-in pressure was set to 70 psig as requested in the STEM Work Request dated 7/21/2015. The signed Engineering Evaluation was completed with a shut-in pressure of 65 psig. Requested confirmation of separator shut-in pressure.

NEI Data Request Response:

Rework reduced the LP separator max pressure to 65 psig. The completed rework is being provided in this 2nd Information Request Response titled 066\_KATE WHITE JESSIE T3N-R64W-S29 L01 COMPLETED REWORK which provides confirmation that the separator control pressure was set as requested.

The single oil tank fill level was certified to 90% with equalizer height as the control method. A single tank is unable to limit fill level via equalizer height and must utilize other means (level switch with production shutdown, etc.) for tank level control. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

**Audit Notes**

Field Datasheet (KAUFMAN T4N-R65W-S8 L01\_FINAL PACKET p 12) does not specify a date but information makes sense with other documentation. No date listed for Facility Scouting at the beginning of the Final Packet either. Assuming Field Datasheet was completed prior to any changes on site.

Work Request (KAUFMAN T4N-R65W-S8 L01\_FINAL PACKET, p 4) asks for the 2" oil dump valve to be replaced with a 1400, 1/2" trim. Cannot confirm this task was completed with existing documentation. Conservatively assumed 2" valve is still installed.

It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

**LOD ID:** KEISHA WHITE WOODY ABBEY T3N-R64W-S1 L01

**Consent Decree Tank System Number:** 542

**Audit Notes**

The walkdown checklist (KEISHA WHITE WOODY ABBEY T3N-R64W-S1 L01\_WALKDOWN) was not marked as complete. Completion was verified through other documentation in the final packet (KEISHA WHITE WOODY ABBEY T3N-R64W-S1 L01\_FINAL PACKET).

The Work Request Form says "Disconnect HP oil dumps on separator #1 and #3 and route to old Keisha White D1-1,7,8 separator #2 converted to LP". The Job Sheet makes no mention of making this change. However the walkdown checklist item C5 on page 7 of the final packet and 2 oil dump lines abandoned on page 26 of the final packet were used to confirm this change.

LOD ID: **KERKSIEK T6N-R64W-S18 L02**

Consent Decree Tank System Number: **1918/1424**

**Audit Notes**

The single oil tank fill level was certified to 90% with equalizer height as the control method. A single tank is unable to limit fill level via equalizer height and must utilize other means (level switch with production shutdown, etc.) for tank level control. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

The Field Data Sheet indicated the VOC line on the top of the oil storage tanks to the KO pot was 2" NPS. There is no request to modify this section of piping. The NEI evaluation was completed with a 3" NPS from the tanks to the KO piping section. There is no confirmation of the piping modification. It is unknown whether the Engineering Design Standard was properly applied.

LOD ID: **KERN T3N-R64W-S2 L01**

Consent Decree Tank System Number: **1121**

**Audit Notes**

THE WALKDOWN CHECKLIST WAS NOT MARKED COMPLETE.

There is no documentation that the 2" tank VOC line was replaced with a 3" as requested in the STEM Work Request form (Item 2 of the TANKS section, pg 3/29 of the Final Packet). Noble's Engineering Evaluation considers a 3" tank VOC line. It is unknown if the engineering design standard was strictly followed. Noble's model was rerun using 2" tank VOC line and the appropriate numbers added to the SLR Audit Checklist. Based on the more conservative numbers the VCS is still adequate for the expected PPIVF.

There is no documentation that the trim size for the LP oil dump valve was verified to be 1/2". The positive response ("YES") to Item A1 of the STEM Retrofit Walkdown Checklist will be used as confirmation that the trim size is consistent with the Engineering Evaluation.

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

Consent Decree Tank System Number: **1964**

**Audit Notes**

A Work Order request was issued to "bottom out" two tanks; remove the fill line from the tank while keeping the tank connected to the VCS in order to be utilized as head space only. The accompanying Job Sheet confirmed the tanks were "bottomed out," but the Walkdown Checklist was not checked as complete to "Confirm all the items on the work request form have been completed." Additionally, the provided STEM Retrofit Walkdown Checklist, Item C14, indicates all tank fill lines are configured to enable the LP separator to produce into all tanks.

Additional information is needed to clarify the inconsistent and conflicting information, thus it is unknown whether the Engineering Design Standard was properly applied.

NEI Data Request Response:

Field verification for this facility was completed on or around 6/21/17, field verification confirmed that two tanks were converted into headspace tanks (i.e. removed from liquid service but remained connected to vapor header).

## Engineering Evaluation Verification Audit

Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **KERN T8N-R63W-S20 L01**

Consent Decree Tank System Number: **1998**

### Audit Notes

THE WALKDOWN CHECKLIST WAS NOT MARKED COMPLETE.

The stem work request form (PG 3 of FINAL PACKET pdf) states the pneumatic pssh was to be set to shut in @ 165 psig in the HP separator however nowhere in the job sheets (PGs 20 through 24 of FINAL PACKET pdf) does it confirm this task was completed.

NOBLE RESPONSE:

Rework was completed on or around 4/11/2018, which increased the HP separator pressure to no higher than 220 psig.

**Audit Notes**

**QC STEM Checkout Form**

The QC STEM Checkout Form (Final Packet, pg 26) indicates the LP separator with SN: 3855 was set to shut in at 60psi. The Field Datasheets (Final Packet, pg 14) indicates the HPLP separator, the separator which has remained onsite and is operating, has a serial number of SN: 3835 for the HP side, and SN: 3872 for the LP side of the separator.

The LP Sep (SN: 3855) which was set to shut in at 60 psi on the QC STEM Checkout form, does not match the serial numbers of the separator which was previously onsite. SLR believes this to be a typo, as ITEM B3 is checked "yes" in the STEM Walkdown Checklist (Final Packet, pg 28), confirming max separator set pressures are set according to design.

LOD ID: **KISSLER BOOTH T4N-R64W-S23 L01**

Consent Decree Tank System Number: **468**

**Audit Notes**

The walkdown checklist (KISSLER BOOTH T4N-R64W-S23 L01\_WALKDOWN, p 4) was not marked as complete. Completion was confirmed through other documentation in the final packet (KISSLER BOOTH T4N-R64W-S23 L01\_FINAL PACKET).

A Leed 270 Separator was installed (KISSLER BOOTH T4N-R64W-S23 L01\_FINAL PACKET, p 20) on the site after the existing separators were removed. The walkdown checklist (KISSLER BOOTH T4N-R64W-S23 L01\_WALKDOWN, p 1) A1 confirms it has a 1/2" trim, but there is no indication of the new valve size. A 2" valve was used in the model to be conservative. It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

The separator pneumatic PSHH is set by the operator not automation and therefore no QA/QC checklist was provided to confirm the maximum pressure of the separator. The STEM One-Pager states that the separator cannot operate above 140 psig and was posted on location via item A14 of the Walkdown Checklist. This serves as confirmation of administrative controls in place to keep the separator below the maximum pressure used in the Engineering Evaluation.

Consent Decree Tank System Number: **244**

**Audit Notes**

The Work Request indicated the oil dump valves on Separators 1 & 3 were to be modified to Kimray 1400 with 1/2 inch trims. Could not verify the oil dump valve size (2" or 1") on either separator with the documentation provided. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim.

It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

## Engineering Evaluation Verification Audit

Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **KLEIN T5N-R64W-S16 L01**

Consent Decree Tank System Number: **308**

### Audit Notes

The walkdown states there are 2 banks of tanks (5 oil and 4 oil). Signed evaluation and field data sheets indicate that the tanks are not banked. Noble provided a response to the above discrepancy on 12/10/2018 that states "The Tank Truck Loadout Final Packet dated 12/9/2016, provides confirmation that tanks are not banked."

**Audit Notes**

The stem work request and job sheets confirm the lp oil dump valve and trim was changed to a 1" 1400 with ½" trim however it appears the site was modeled with a 2" dump valve with ½" trim according to the stem engineering design form.

Consent Decree Tank System Number: **164**

### Audit Notes

The Walkdown checklist (KROPP RUZICANO SILBERMAN T4N-R66W-S23 L01\_WALKDOWN) was not marked as being complete. The site was verified through other supplied documentation in the final packet (KROPP RUZICANO SILBERMAN T4N-R66W-S23 L01\_FINAL PACKET, p 27).

Per the Work Request (KROPP RUZICANO SILBERMAN T4N-R66W-S23 L01\_FINAL PACKET.pdf, pg. 15) the oil dump valve is 2". The Job Sheet (KROPP RUZICANO SILBERMAN T4N-R66W-S23 L01\_FINAL PACKET.pdf, pg 18) confirms 1/2" trim installed but does not indicate the oil dump valve size. The run model KROPP RUZICANO SILBERMAN T4N-R66W-S23 L01\_STEM Engineering Evaluation\_rev1) indicates the valve was 1". There was no documentation to change the valve size. A 2" valve was used in these calculations to be conservative. It is unknown if the modeling guideline was strictly followed for the tank system.

This site was selected for an additional IR camera inspection because the video is blurry.

**Audit Notes**

**1. STEM Walkdown Checklist**

ITEM C8 of the STEM Walkdown Checklist (Final Packet, pg 27) is checked "yes" indicating multiple LP oil dumps tie into a single line. Only (1) LP oil dump exists onsite, therefore ITEM C8 is marked incorrectly on the checklist.

ITEM C13 of the STEM Walkdown Checklist (Final Packet, pg 27) is checked "yes" indicating the LP separator can produce into all tanks, indicating there is not a vapor surge vessel onsite. The Engineering Evaluation and STEM Work Request Form (Final Packet, pg 3) indicate a vapor surge vessel should be onsite. See "Vapor Surge Vessel" note below for more.

**2. Vapor Surge Vessel**

A Work Order request was issued to "bottom out" one oil tank; remove the oil fill line from the tank while keeping the tank connected to the VCS in order to be utilized as head space only. The accompanying Job Sheet did (did not) confirm a tank was "bottomed out" and the Walkdown Checklist was not checked as complete to "Confirm all the items on the work request form have been completed." Additionally, the STEM Retrofit Walkdown Checklist, Item C13, was checked "yes" indicating all tank fill lines are configured to enable separator to produce into all tanks. Additional information was not provided to clarify the inconsistent and conflicting information, thus it is unknown whether the Engineering Design Standard was properly applied.

**Request confirmation from Noble that one tank was bottomed out (isolated from liquid service and used as headspace only tank).**

**UPDATE 11/26/2018 - Noble confirmed an oil tank was bottomed out and converted into a vapor surge vessel onsite. The Engineering Design Standard has been properly applied.**

**3. Oil Dump Valve Trim Size**

Pg 21 of the Final Packet indicates a new LP separator was installed, which dumps to the oil tanks. The maximum oil dump valve size is specified at 1/2-inch. No data was provided indicating the size of the oil dump valve or the valve trim size. ITEM A1 in the STEM Walkdown Checklist (Final Packet, pg 25) is checked "yes" indicating the oil dump valve trim size onsite is consistent with that used in the Engineering Evaluation, and is therefore 1/2"

**4. Field Datasheets are not dated**

The Field Datasheets (Final Packet pg 9-14) are not dated. Date assumed to be same as Facility Scouting Date (12/21/2015).

Consent Decree Tank System Number: **1497**

**Audit Notes**

The walkdown checklist (LANG T7N-R64W-S35 L01\_WALKDOWN\_REWORK) was not marked as being complete. Completion was verified through other documentation in the final packet (LANG T7N-R64W-S35 L01\_FINAL\_PACKET\_REWORK).

Page 46 of the FINAL PACKET REWORK (LANG T7N-R64W-S35 L01\_FINAL\_PACKET\_REWORK) states a new D grade separator was installed. A1 from the walkdown checklist (LANG T7N-R64W-S35 L01\_WALKDOWN\_REWORK, p 4) confirms the 1/2" trim on the signed eval (LANG T7N-R64W-S35 L01\_SIGNED\_EVAL\_REWORK) is correct. A 2" valve was used in these calculations to be conservative. It is unknown if the modeling guideline was strictly followed for the tank system.

Consent Decree Tank System Number: **2146**

**Audit Notes**

**Oil Dump Valve Size**

Job Sheet (Final Packet, pg 23) confirms a new LP separator was installed onsite which dumps to the oil tank. A 2" valve with 3/4" trim was used in the Engineering Evaluation, no documentation is provided to confirm this 2" valve was/is installed on the LP separator.

A 3/4" valve trim is confirmed using ITEM A1 in the STEM Walkdown Checklist (Final Packet, pg 29). ITEM A1 is checked "yes" indicating the oil dump trim is consistent with that used in the Engineering Evaluation and is therefore 3/4". For the given trim size, 3/4", a 2" valve is the largest valve size possible. A 2" valve was used in the Engineering Evaluation and therefore SLR can confirm the Modeling Guideline as being strictly applied.

**Single Tank Battery**

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

**Audit Notes**

A Work Order request was issued to "bottom out" one oil tank; remove the oil fill line from the tank while keeping the tank connected to the VCS in order to be utilized as head space only. The accompanying Job Sheet did (did not) confirm the tank was "bottomed out "and the Walkdown Checklist was (was not) checked as complete to "Confirm all the items on the work request form have been completed." Additionally, the provided STEM Retrofit Walkdown Checklist, Item C13, was checked "yes" indicating all tank fill lines are configured to enable LP separators to produce into all tanks.

Additional information was not provided to clarify the inconsistent and conflicting information, thus it is unknown whether the Engineering Design Standard was properly applied.

NEI Data Request Response:

Field verification for this facility was completed on or around 2/24/17, field verification confirmed that one tank was converted into a headspace tank (i.e. removed from liquid service but remained connected to vapor header).

Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **LDS T6N-R65W-S34 L01**

Consent Decree Tank System Number: **2030**

**Audit Notes**

**1. Field Datasheets are not dated**

The Field Datasheets (Final Packet pg 4-9) are not dated. Date assumed to be same as Facility Scouting Date (6/22/2015).

**2. Vapor Surge Vessel - Request additional data**

The Engineering Evaluation shows a vapor surge vessel onsite. However, no documentation is provided which indicates a vapor surge vessel existed previously or that one exists currently onsite. ITEM C13 of the STEM Walkdown Checklist (Final Packet, pg 17) is checked "yes" indicating the LP separator can produce into all tanks, indicating there is not a surge vessel onsite.

**Request verification from Noble of a vapor surge vessel onsite.**

**UPDATE 11/26/2018 - Noble provided documentation indicating one oil tank has been converted to a vapor surge vessel onsite. The Engineering Design Standard has been properly applied.**

**3. HP Separator Operating Pressure - Request additional data**

(1) HP separator and (1) LP separator exist onsite. QC Stem Checkout form (Final Packet, pg 23) and the automation support email (Final Packet, pg 24) confirm the LP separator has a max operating pressure of 70 psi.

Field datasheets (Final Packet, pg 7) show the HP separator onsite previously operating at 500 psi. The Engineering Evaluation indicates the HP separator is currently operating at 400 psi, which is standard pipeline pressure. No data required.

**4. Water Valve Dump Sizes - Request additional data**

The Engineering Evaluation shows both HP & LP water dumps to have a max trim size of 1". No documentation is provided to indicate the actual onsite trim size for the HP & LP water dumps. ITEM A2 of the STEM Walkdown Checklist (Final Packet, pg15) is checked "N/A", indicating it is unknown if the water dump trims are consistent with those used in the Engineering Evaluation.

**Request documentation of HP & LP separator water dump valve trim sizes.**

**NOBLE UPDATE - Field verification for this facility was completed on or around 11/20/2018, field verification confirmed that the valve trim size for the water dump valve is 1-inch.**

**Engineering Evaluation Verification Audit**  
Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **LDS WHITE T3N-R64W-S17 L01**

Consent Decree Tank System Number: **1129**

**Audit Notes**

**1. Field Datasheets are not dated**

The Field Datasheets (Final Packet, pg 11-16) are not dated. Date assumed to be same as Facility Scouting Date (9/14/2016).

**2. Diameter of VOC lines**

The Engineering Evaluation shows (1) 3" VOC line from tanks to KO and (1) 3" line from KO to burner. Field Datasheet (Final Packet, pg 12) show a 3" VOC line from tanks to KO and the Field Datasheet (Final Packet, pg 15) shows a 2" VOC line from KO to burner.

There is not a work request provided in the documentation which shows a requested VOC line change from 2" to 3". Therefore SLR is assuming the 2" VOC line from KO to burner still exists onsite.

**3. Oil Dump Valve Size - Unknown**

Field Datasheet (Final Packet, pg 14) shows the separator onsite originally had a 2" oil dump valve with unknown trim size. **ITEM A1 of the STEM Walkdown Checklist is checked "yes" indicating the oil dump trim size onsite is consistent with the trim size used in the Engineering Evaluation.**

A 1" oil dump valve is used in the Engineering Evaluation, no documentation is provided to confirm this valve was/is installed on the HLP separator. For the given trim size, ½", a 2" valve could be installed and therefore the modeling guideline cannot be confirmed as being followed. Assuming a 2" valve size on the separator, the modeled results do not show an exceedance of the vapor control system capacity.

**4. Tank Fill Level**

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

Consent Decree Tank System Number: **480**

**Audit Notes**

Separator 3 (Lehfeldt C27-25) initially has a 2" 212 SMA valve per the Field Data Sheet (LEHFELDT HERBST T4N-R64W-S27 L02\_FINAL PACKET.pdf, pg 16). Job Sheet (LEHFELDT HERBST T4N-R64W-S27 L02\_FINAL PACKET.pdf, pg 25) confirms it was changed to a 1/2" trim, however, there is no documentation confirming that the valve itself was swapped with the 1" 1400 SMA. SLR assumes the valve was changed because a 212 SMA cannot utilize an alternate trim size.

A Work Order request was issued to "bottom out" one oil tank; remove the oil fill line from the tank while keeping the tank connected to the VCS in order to be utilized as head space only. The accompanying Job Sheet did not confirm the tank was "bottomed out" and the Walkdown Checklist was not checked as complete to "Confirm all the items on the work request form have been completed." Additionally, the provided STEM Retrofit Walkdown Checklist, Item C13, was checked "yes" indicating all tank fill lines are configured to enable LP separators to produce into all tanks.

Additional information is needed to confirm the conflicting information regarding the conversion of a storage tank to a vapor headspace tank.

NEI Data Request Response:

Field verification for this facility was completed on or around 5/3/2016, field verification confirmed that one tank was converted into a headspace tank (i.e. removed from liquid service but remained connected to vapor header).

**Audit Notes**

The STEM Work Request indicates the PSHH is to be set to 65 psig. The Job Sheet indicates the Versa and Fisher 4660 have been set to 65 psig. The signed Engineering Evaluation and the Engineering Evaluation spreadsheet have a maximum pressure of 55 psig. A rework request dated 1/4/2018 provided by Noble in response to the draft audit report confirms that the Versa and Fisher 4660 have been set to 55 psig.

Consent Decree Tank System Number: **1488**

**Audit Notes**

The Work Request, pg. 3, and the Job Sheet, pg. 19, indicate a new HLP Separator was installed on-site and the HP dumps routed to the new Separator. The new LP separator oil dump valve body size is not indicated within the provided documentation. The LP Separator dump valve trim size is confirmed as 1/2" per the Walkdown Checklist, Item A1. Valve sizing was not confirmed, so the largest valve size with the given trim was used to evaluate adequacy of design/ VCS capacity. It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

The work request (FINAL PACKET p. 3) states that the VOC line from the tank to the KO needs to be changed from 2" to 3". There is no verification that this work was completed. The data request response delivered on November 14, 2018 Noble states "Field verification for this facility was completed on or around 12/2/2015, field verification confirmed that the 3" VOC line from the tank to the KO was installed."

The tank system consists of a single oil tank. The signed evaluation states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

Consent Decree Tank System Number: **461/460/811**

**Audit Notes**

The STEM Work Request indicated the 2" VOC line on the top of the oil storage tanks to the KO pot was to be replaced with a 3" line. There is no confirmation that the piping modification occurred. The Engineering Evaluation was completed with a 3" NPS for this section of pipe.

Noble provided information on 11/14/2018 indicating a "Field verification for this facility was completed on or around 8/4/2016, field verification confirmed that the 3" VOC line from the tank to the KO was installed." The Engineering Design Standard was appropriately applied based on the provided field verification information.

The Work Request indicated the oil dump valve on the HLP Separator was to be modified from a Kimray 212 SMA to a Kimray 1400 with 1/2 inch trims. Could not verify the oil dump valve was modified with the documentation provided. The Walkdown Checklist, Item A1 indicates the oil dump trims are consistent with the Engineering Evaluation. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim.

It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

LOD ID: **LILLI UNIT T8N-R59W-S1 L01**

Consent Decree Tank System Number: **1690**

**Audit Notes**

**1.) Disposition of LP gas unknown - Field Datasheet incomplete**

The Field Datasheets (Final Packet, pp. 9 and 12) indicate there were two (2) vertical separators and a single Leed tank burner originally onsite, but the disposition of the oil outlets and LP gas is not indicated on the sheets. The Job Sheet (Final Packet, pg 19) states "[r]eplaced Leed tank burner with new Leed [burner]," and "Installed 1 inch orifice plate downstream of 3" LP heater treater oil dump valve." The signed Engineering Evaluation indicates one (1) HP separator dumps to the tanks. Since there is only one burner, the disposition of the LP gas is important. If the LP gas is routed to the tank burner, the Modeling Guideline and Engineering Evaluation is impacted. It appears based on the Field Datasheets that a vertical HP separator (two-phase?) dumps liquids to HP treater, but confirmation should be provided.

**REQUEST DOCUMENTATION OF DISPOSITION OF LP GAS (i.e., sales or LP gas to tank burner) AND HP SEPARATOR OIL.**

**UPDATE 11/26/2018 - Noble's response to data request... "Engineering review was completed on or around 10/4/2018, engineering review confirmed that the LILLI UNIT T8N-R59W-S1 L01 operates as HP-LP, because there is no LP gas header, and the operating pressure limit is imposed on the HP separator, the evaluation is written up as an HP-only design."**

**Audit Notes**

A new LP separator was brought on-site to develop a HP-LP train. Could not verify the oil dump valve size (2" or 1") of the new LP separator. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim.

It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.  
NEI Data Request Response:

The specific valve size/type is not a critical aspect of the design. Field verification of the valve size would not impact the adequacy of design determination, as the typical design targets 20-30% contingency.

**Audit Notes**

1. The Work Request, pg. 3, and the Job Sheet, pg. 21, indicate a new LP Separator was installed on-site and the HP dumps routed to the new Separator. The new LP separator oil dump valve body size is not indicated within the provided documentation. The LP Separator dump valve trim size is confirmed as 1/2" per the Walkdown Checklist, Item A1.

Valve sizing was not confirmed, so the largest valve size with the given trim was used to evaluate adequacy of design/ VCS capacity.

It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

LOD ID: **LOUSTALET JOHNSON T4N-R64W-S30 L01**

Consent Decree Tank System Number: **1759**

**Audit Notes**

The single oil tank fill level was certified to 90% with equalizer height as the control method. A single tank is unable to limit fill level via equalizer height and must utilize other means (level switch with production shutdown, etc.) for tank level control. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

LOD ID: **LOUSTALET T4N-R64W-S30 L02**

Consent Decree Tank System Number: **1831**

**Audit Notes**

**Unknown Oil Dump Valve Size**

Job Sheet (Final Packet, pg 22) confirms a new LP separator was installed onsite and dumps to the tank. A 1" oil dump valve with 1/2" trim was used in the Engineering Evaluation. ITEM A1 of the STEM Walkdown Checklist is checked "yes", indicating a 1/2" oil dump trim size is currently installed on the LP separator onsite.

No documentation is provided to confirm a 1" oil dump valve was/is installed on the LP separator. For the given trim size, 1/2", a 2" valve could be installed and therefore the Modeling Guideline cannot be confirmed as being strictly applied. Assuming a 2" valve size on the separator, the modeled results do not show an exceedance of the vapor control system capacity.

**Single Tank Battery**

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

**Audit Notes**

1. The Work Request, pg. 3, and the Job Sheet, pg. 37, indicate a new LP Separator was installed on-site and the HP dumps routed to the new Separator. The new LP separator oil dump valve body size is not indicated within the provided documentation. The LP Separator dump valve trim size is confirmed as 1/2" per the Walkdown Checklist, Item A1.

Valve sizing was not confirmed, so the largest valve size with the given trim was used to evaluate adequacy of design/ VCS capacity.

It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

Consent Decree Tank System Number: **309**

**Audit Notes**

The separator on location has pressure controlled by a pneumatic controller. The initial provided documentation did not confirm that the controller shut-in pressure for the HP Separator was set to 110 psig as requested in the STEM Work Request dated 9/23/2015.

The separator pneumatic PSHH is set by the operator, not automation personnel, and therefore no QA/QC checklist was provided to confirm the maximum pressure of the separator. The STEM One-Pager states the separator cannot operate above 110 psig and was posted on location via Walkdown Checklist Item A14. This serves as confirmation of administrative controls in place to keep the separator below the maximum pressure used in the Engineering Evaluation. It was determined the Modeling Guidelines were appropriately applied based on the administrative use of the One-Pager.

**Engineering Evaluation Verification Audit**  
Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

**LOD ID:** **LOVELACE T7N-R63W-S32 L01**

**Consent Decree Tank System Number:** **1668**

**Audit Notes**

The walkdown checklist (LOVELACE T7N-R63W-S32 L01\_WALKDOWN) was not marked as being complete. Completion was verified through other documentation in the final packet (LOVELACE T7N-R63W-S32 L01\_FINAL PACKET) where applicable.

The STEM work request (LOVELACE T7N-R63W-S32 L01\_FINAL PACKET, p 3) requests the installation of a D-Grade LP separator. The job sheet (LOVELACE T7N-R63W-S32 L01\_FINAL PACKET, p 20) confirms a new LP separator was installed. A1 from the walkdown checklist (LOVELACE T7N-R63W-S32 L01\_WALKDOWN) confirms the 1/2" trim size, but there is no confirmation of the valve size. A 2" valve was used in the model to be conservative. It is unknown if the modeling guideline was strictly applied.

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

## Engineering Evaluation Verification Audit

Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **LOWER LATHAM T4N-R65W-S2 L01**

Consent Decree Tank System Number: **242**

### Audit Notes

Installation of two additional VOC combustors: The Work Request Form calls for the use of five total combustors, including the installation of two additional VOC combustors, on this site. The provided documents did not confirm the installation of the two additional VOC combustors. Google Earth photos show that the appropriate number of combustors (five) are on location. The Signed Evaluation lists the appropriate number of VOC combustors for the tanks. INFO. REQUEST - Confirm that the VCS is connected to four combustors (two -Leed 48 Gen 1 #7, one - 48" Tornado and one COMM 200 48"). Noble responded to data request as follows "1) Field verification completed on or around 1/12/18 confirmed there are two leed 48", one 48" Tornado and one Comm 48" combustor."

Dump valve modifications: The Work Request form prescribes several dump valve trims being changed. Other than Items A1 and A2 on the Walkdown Checklist, there are no other documents confirming the G11-69HN oil dump valve trim being reduced to 3/4", or the G12-69HN oil dump valve trim being reduced to 1/2" or the G11-69HN water dump valves being reduced to 3/4". The Signed Evaluation lists the appropriate trim size for each dump valve as prescribed in the Work Request Form. Walkdown Checklist, Items A1 and A2 will be used as confirmation that the dump valve trims were reduced as specified in the field documents and signed evaluation.

- VCS Line Sizes: A line size change for the VOC line from the KO to the burner is not listed in the Work Request Form. The Final Packet, page 16 identifies the size of the VOC line from the KO to burner as 3" for both production trains. The Signed Evaluation considers the VOC line from the KO to the burner as 4". In the documentation, there is no confirmation that the line size was changed from 3" to 4". Noble responded to data request as follows "e VOC line from the KO to Burners is confirmed to be 4" diameter as requested in the work scope. Confirmation was by field verification completed on or around 2/16/16."

- VCS Line Configuration: Item 3 in the Tanks section of the Work Request Form asks that the two 3" AGL VOC headers from the tanks to burners be "tee'ed together". Google Earth photos seem to indicate that the two separate VOC header were replaced with a single VOC header across the top of the tanks, to the KO and out to the combustors. The TLO document will be used as confirmation that the tank VOC line controls all of the 300 bbl tanks. The Signed Evaluation considers a single VOC header system controlling five (5) oil tanks and one (1) produced water tank.

LOD ID: **LOWER LATHAM T4N-R65W-S2 L02**

Consent Decree Tank System Number: **239**

**Audit Notes**

The Walkdown checklist (LOWER LATHAM T4N-R65W-S2 L02\_WALKDOWN) was not marked as being complete. Completion was verified through other documentation in the final packet (LOWER LATHAM T4N-R65W-S2 L02\_FINAL PACKET).

The STEM work request (LOWER LATHAM T4N-R65W-S2 L02\_FINAL PACKET, p 3) requests Sep #2 and Sep #3 be combined to be a HLP separator. As per the field datasheet (LOWER LATHAM T4N-R65W-S2 L02\_FINAL PACKET) Sep #2 and Sep#3 have a 2" valve and a 1" trim. The STEM work request instruct the operator to replace the 2" 212 SWA with a 1400 with a 1/2" trim. The Job sheet (LOWER LATHAM T4N-R65W-S2 L02\_FINAL PACKET, p 23) confirms sep #1's were replaced with a 1400. A1 from the walkdown checklist (LOWER LATHAM T4N-R65W-S2 L02\_WALKDOWN,p 1) confirms the 1/2" trim was also installed. There was no documentation of updating Sep#3 to a 1" valve. A1 from the walkdown checklist confirms a 1/2" trim was installed on sep #3. Therefore, a 2" valve was used in the model to be conservative.

The field data sheet (LOWER LATHAM T4N-R65W-S2 L02\_FINAL PACKET, p 16) lists the VCS as 2". The STEM work request (LOWER LATHAM T4N-R65W-S2 L02\_FINAL PACKET, p 3) states the VSC line be updated to 4". The job description (LOWER LATHAM T4N-R65W-S2 L02\_FINAL PACKET, p 23) confirms the AGL was updated, but is not specific to the size. It is assumed that the line was updated from 2" to 4" as requested in the STEM work order.

Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **LUCCI T5N-R64W-S1 L01**

Consent Decree Tank System Number: **296**

**Audit Notes**

The walkdown checklist (LUCCI T5N-R64W-S1 L01 & LUCCI T5N-R64W-S1 L06\_WALKDOWN) was not marked as being complete. Completion was verified through other documents in the final packet (LUCCI T5N-R64W-S1 L01 & LUCCI T5N-R64W-S1 L06\_FINAL PACKET) .

The STEM work request (LUCCI T5N-R64W-S1 L01 & LUCCI T5N-R64W-S1 L06\_FINAL PACKET, p 4) requests the VOC from the tanks to the KO burner be upgraded from 2" to 3". The job sheet (LUCCI T5N-R64W-S1 L01 & LUCCI T5N-R64W-S1 L06\_FINAL PACKET, p 22) does not confirm updating the diameter. The data request response received 11/14/2018 Noble states "Field verification for this facility was completed on or around 3/11/2016, field verification confirmed that the 3" VOC line from the tank to the KO was installed."

As per the STEM work request (LUCCI T5N-R64W-S1 L01 & LUCCI T5N-R64W-S1 L06\_FINAL PACKET, p 4) and job sheet (LUCCI T5N-R64W-S1 L01 & LUCCI T5N-R64W-S1 L06\_FINAL PACKET, p 22) separator #3 was routed to Separator #2. Separators #1 & #2 both are listed as having 2" 212 SMA valves. The Job sheet (LUCCI T5N-R64W-S1 L01 & LUCCI T5N-R64W-S1 L06\_FINAL PACKET, p 22) does not confirm updating the valves to 1" as requested in the work request (LUCCI T5N-R64W-S1 L01 & LUCCI T5N-R64W-S1 L06\_FINAL PACKET, p 4). The walkdown checklist (LUCCI T5N-R64W-S1 L01 & LUCCI T5N-R64W-S1 L06\_WALKDOWN,p 1) A1 confirms that the trim was replaced with a 1/2" trim. The valve was run at 2" in the model to be conservative. It is unknown whether the Modeling Guidance was correctly applied since it is unconfirmed if the valves were changed.

**Audit Notes**

The Work Request indicated the oil dump valve on the separator was to be modified to a Kimray with 1/2 inch trim. Could not verify the oil dump valve size (2" or 1") on the separator with the documentation provided. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim. The signed evaluation used a 1" valve size. It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

**Audit Notes**

A Work Order request was issued to "bottom out" one oil tank; remove the oil fill line from the tank while keeping the tank connected to the VCS in order to be utilized as head space only. The accompanying Job Sheet did not confirm a tank was "bottomed out" and the Walkdown Checklist was not checked as complete to "Confirm all the items on the work request form have been completed." Additionally, the provided STEM Retrofit Walkdown Checklist, Item C13, was checked "yes" indicating all tank fill lines are configured to enable LP separators to produce into all tanks.

Noble provided additional information on 11/14/2018 indicating a "Field verification for this facility was completed on or around 12/17/2015, field verification confirmed that one tank was converted to a headspace tank." The Engineering Design Standard has been appropriately applied based on the provided field verification information.

LOD ID: **LUNDVALL STEVE T5N-R66W-S30 L01**

Consent Decree Tank System Number: **1313**

**Audit Notes**

**1. Field Datasheets**

The Field Datasheets (Final Packet, pg 12-17) are not dated. Assumed the date is the same as Facility Scouting date (7/25/2016).

**2. Oil dump valve size not verified**

The work request form (Final Packet, pg 4) indicates the existing 2" 212 dump valves on the separator were to be replaced with 1" 1400 valves with 1/2" trim.

Item A1 of the walkdown checklist (Final Packet, pg 28) is marked "yes" verifying the correct trim size was installed. No indication of the dump valve size was observed.

Assuming the 2" dump valve was not replaced results in a slightly larger PPIVFR than calculated by the engineering evaluation. However, this does not result in an exceedence of the VCS capacity.

Consent Decree Tank System Number: **2116**

**Audit Notes**

**1. Oil dump valve size unknown**

The STEM Work Request (Final Packet, pg 3) requests a new HLP separator be installed onsite as well as the oil dump valve trim size on that separator to be 1/2". The Job Sheet (Final Packet, pg 20) indicates a new HLP separator was installed onsite however the Job Sheet does indicate the valve size or valve trim size. Item A1 in the STEM Walkdown Checklist (Final Packet, pg 26) is checked "yes", indicating the oil dump valve trim is a 1/2".

A 1" oil dump valve is used in the Engineering Evaluation, no documentation is provided to confirm this valve was/is installed on the HLP separator. For the given trim size, 1/2", a 2" valve could be installed and therefore the modeling guideline cannot be confirmed as being followed. Assuming a 2" valve size on the separator does not show an exceedance of the vapor control system capacity.

**2. Separator maximum operating pressure discrepancy**

The Job Sheet (Final Packet pg 20) indicates the separator maximum operating pressure was set to 50 psig. The STEM Work Request form (Final Packet pg 3) and QC Stem Checkout (Final Packet pg 25) indicate the separator maximum operating pressure was set to 60 psig. The Signed Evaluation used 60 psig and would overestimate the actual PPIVFR if the set point were in fact 50 psig.

**3. Field Datasheets are not dated**

The Field Datasheets (Final Packet pg 9-14) are not dated, no facility scouting date included. Date assumed to be prior to STEM Work Request Form date (11/13/2015).

LOD ID: **MALO T8N-R59W-S20 L01**

Consent Decree Tank System Number: **1649**

**Audit Notes**

The walkdown checklist (MALO T8N-R59W-S20 L01\_WALKDOWN) was not marked as being complete. Completion was verified through other documentation in the final packet (MALO T8N-R59W-S20 L01\_FINAL PACKET) where applicable.

Documentation indicates that a 1" flow orifice is used in combination with a valve to restrict flow from the LP separator. NEI provided a summary of their derivation of combined flow valve-orifice flow characteristics. SLR used Cf and Cv as provided by NEI.

The separator pneumatic PSHH is set by the operator, not automation, and therefore no QA/QC checklist was provided to confirm the maximum pressure of the separator. The STEM One-Pager states that the separator cannot operate above 155 psig and was posted on location via Walkdown Checklist Item A14. This serves as confirmation of administrative controls in place to keep the separator below the maximum pressure used in the Engineering Evaluation.

There were inconsistencies in the number of tanks present on the site.

- The walkdown checklist states there are 2 oil tanks on site (8/9/2007)
- The signed Evaluation was completed with 2 oil tanks on site (8/21/2017)
- The IR video shows 2 tanks on site (8/9/2017)
- The Field datasheet from the Final packet (page 10) shows 2 oil tanks and 1 water tank. (2017)
- The Ariel photo from the Final Pack (page 18) shows 3 tanks (unknown date).

The most current data (walkdown checklist and IR camera videos) were used as confirmation of the number of tanks on site.

There were also inconsistencies about whether or not one of the tanks was converted into a headspace tank. The Work Request specified that a tank was to be bottomed out and used as headspace. There is no confirmation that this was completed. The data request response from 12/21/2018 Noble stated "Field verification for this facility was completed on or around 5/23/2017, field verification confirmed that one tank was converted to a headspace tank."

**Audit Notes**

A new LP separator was brought on-site to develop a HP-LP train. Could not verify the oil dump valve size (2" or 1") of the new LP separator. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim. It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

The STEM Work Request indicates the 2" VOC line on the top of the oil storage tanks to the KO pot was to be replaced with a 3" line. There is no confirmation that the piping modification occurred. The Engineering Evaluation was completed with a 3" NPS for this section of pipe.

Noble provided information on 11/14/2018 indicating a "Field verification for this facility was completed on or around 8/15/2017, field verification confirmed that the 3" VOC line from the tank to the KO was installed." The Engineering Design Standard was appropriately applied based on the provided field verification information.

LOD ID: **MARSHALL MEL SMOOKLER RURAL LAND T4N-R65W-S32 L01**

Consent Decree Tank System Number: **365**

**Audit Notes**

**1. HLP Separator Serial Number Discrepancy**

The Installed Equipment Sheets (Final Packet, pg 24) indicates the HLP separator which remains onsite and was repurposed to be the only separator onsite which dumps to the oil tanks has a Serial Number of 30161. The QC STEM Checkout (Final Packet, pg 21) indicates the separator which dumps to the tanks onsite has a Serial Number of 30163. SLR assumes the Serial Number on the QC STEM Checkout to be a mistake and should instead read 30161.

**2. Oil dump valve size unknown**

The Field Datasheet (Final Packet, pg 14) indicates that the existing HLP separator which remains onsite originally had a 2" oil dump valve. The Work Request (Final Packet, pg 3) specifies that the 2" valve be replaced with a 1" valve but no documentation was provided confirming this work was completed. A 1" oil dump valve is used in the Engineering Evaluation, no documentation is provided to confirm this valve was/is installed on the HLP separator. For the given trim size, ½", a 2" valve could be installed and therefore the modeling guideline cannot be confirmed as being followed. Assuming a 2" valve size on the separator does not show an exceedance of the vapor control system capacity. It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

**3. Field Datasheets are not dated**

The Field Datasheets (Final Packet pg 11-16) are not dated, no facility scouting date included. Date assumed to be prior to STEM Work Request Form date (2/26/2016).

**Audit Notes**

Item A1 and A2 of the Walkdown Checklist are checked "Yes" indicating that all oil and water dump trims are consistent with the Engineering Evaluation. This will be taken as field documentation that the dump valves were replaced with 1" 1400, 1/2" trim.

There is no field documentation indicating that the LP separator PSHH was set to 60. Item B3 on the walkdown checklist is used as confirmation.

There is no field documentation that confirms the VOC line from the KO to the burner was changed from a 3" to 4" AGL.

Noble Response: The Data Request Response received on 12/10/2018 states that field verification for this facility was completed on or around 4/20/2018 and confirms that the 4" above ground VOC line from the KO to the burner was installed.

Consent Decree Tank System Number: **159**

**Audit Notes**

The Engineering Evaluation was completed with a 4" vapor line from the knockout to the combustor. Field datasheets indicate the vapor line was 2" and below ground. The work request specified that the 2" line was to be replaced with a 4" above ground line. No documentation was provided to verify a new 4" line was installed. Noble provided a response to a data request on 12/10/2018 that states "Field verification for this facility was completed on or around 8/19/2016, field verification confirmed that the 4" above ground VOC line from the knockout to the burner was installed."

**Audit Notes**

The Job Sheet, Installed Equipment page (Final Packet, pg. 37) indicates a Leed HOC 48" unit was installed for the tank burner. The Signed Engineering Evaluation utilizes a Tornado 48" unit. The Leed HOC 48" has a higher capacity than the Tornado 48", thus the use of the Tornado is a conservative approach for the engineering evaluation.

The Work Request (Final Packet, pg 5) requests the current 212 SMA oil dump valve be replaced with a 1" 1400 valve body and 1/2" trim. As a 2" or 1" valve can accommodate a 1/2" trim, it is unconfirmed which valve body size was installed as there is no provided documentation to confirm the installed oil dump valve body is a 1" model. The separator dump valve trim size is confirmed as 1/2" per the Walkdown Checklist, Item A1.

Conservatively assumed the valve to be 2", the larger available valve body size which can accommodate a 1/2" trim.

It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

**LOD ID:** MCCLELLAN FED T8N-R59W-S3 L01

**Consent Decree Tank System Number:** 1948

**Audit Notes**

The STEM Engineering Evaluation file provided was "Not Solved." The solver was engaged and headspace surge rate obtained.

The separator pneumatic PSHH is set by the operator, not automation, and therefore no QA/QC checklist was provided to confirm the maximum pressure of the separator. The STEM One-Pager states that the separator cannot operate above 175 psig and was posted on location via Walkdown Checklist Item A14. This serves as confirmation of administrative controls in place to keep the separator below the maximum pressure used in the Engineering Evaluation.

The signed eval states that the certification max is 65% of the tank height and the control method is "Maintained by Tank Automation ESD." The work request specified to install automation to keep tank levels below 65% but no documentation was provided to confirm the automation was installed. In response to a data request on 5/16/2018 Noble provided an email confirming that tank automation was installed to limit the tanks to 65% full.

Consent Decree Tank System Number: **1971**

**Audit Notes**

It appears from the stem engineering evaluation model that the oil flash factor used was incorrect, thus resulting in quite a substantial difference of the calculated PPIVFR between SLR's calculations and the model Noble used. SLR has calculated an oil tank flash rate of 62,917 scfh compared to Noble's calculated rate of 1,809 scfh. This can be based on the Noble model having set the flash gas ratio to 4scf/bbl rather than using the valko-mccain. While this estimated difference of PPIVFR is large, there is no need for a data request or to rerun the model as the Total VCS Capacity is large enough to handle the PPIVFR

Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **MCKENNEY HOFF T3N-R64W-S6 L01**

Consent Decree Tank System Number: **688**

**Audit Notes**

**Inconsistent HLP Separator Serial Number**

QC STEM Checkout (Final Packet, pg 22) form shows the HLP separator onsite as having serial number 4187L. Field Datasheet (Final Packet, pg 15) show the existing/current HLP separator onsite as having serial number 4178. SLR believes one of these serial numbers to be a typo. Therefore SLR is assuming these separators to be identical and the max separator operating pressure onsite can therefore be confirmed using the QC STEM Checkout form (Final Packet, pg 22).

**3. Oil Dump Valve Size - Unknown**

Field Datasheet (Final Packet, pg 14) shows the separator onsite (SN: 4178) originally had a 2" oil dump valve with unknown trim size. ITEM A1 of the STEM Walkdown Checklist (Final Packet, pg 7) is checked "yes" indicating the oil dump trim size onsite is consistent with the trim size used in the Engineering Evaluation and is therefore 1/2".

A 1" oil dump valve is used in the Engineering Evaluation, no documentation is provided to confirm this valve was/is installed on the HLP separator. For the given trim size, 1/2", a 2" valve could be installed and therefore the Modeling Guideline cannot be confirmed as being strictly applied. Assuming a 2" valve size on the separator, the modeled results do not show an exceedance of the vapor control system capacity.

**4. Inconsistent KO to Burners VOC Line Size**

The Engineering Evaluation shows a 3" VOC line from KO to burner existing onsite currently. The Job Sheet (Final Packet, pg 23) indicates a 4" above ground line from the KO to the burner was installed onsite. A larger diameter VOC line onsite as compared to that in the Engineering Evaluation results in underestimation of the vapor control system capacity, therefore the Engineering Design Standard is considered met.

LOD ID: **MCMILLEN T4N-R65W-S19 L01**

Consent Decree Tank System Number: **131**

**Audit Notes**

Cannot confirm size of existing Tornado combustor with provided documentation. Assuming the combustor is a 48" model, typical of Noble facilities.

-A Work Order request was issued to "bottom out" one oil tank; remove the oil fill line from the tank while keeping the tank connected to the VCS in order to be utilized as head space only. The accompanying Job Sheet did confirm the tank was "bottomed out " But, the provided STEM Retrofit Walkdown Checklist, Item C13, was checked "yes" indicating all tank fill lines are configured to enable LP separators to produce into all tanks. Noble's Response to Data Request on 8/14/2018 was "Field verification for this facility was completed on or around 5/18/16, field verification confirmed that one tank was converted into a headspace tank (i.e. removed from liquid service but remained connected to vapor header)."

LOD ID: **MENONI CONAGRA T5N-R64W-S30 L01**

Consent Decree Tank System Number: **317**

**Audit Notes**

The initial Final Signed Evaluation (dated 6/27/2016) on Page 2 lists 2 tanks on site with 1 bottomed out to be used as vapor headspace. In the Facility Walkdown Page 4, there are 4 tanks listed. The job sheets in the Final Packet Page 17 reference 4 total tanks with 2 as vapor headspace.

NEI Data Request Response:

There are four (4) total tanks onsite, two (2) are in liquid service and two (2) are in vapor-only service. As such, the Engineering Evaluation submitted with File Delivery Oct 31, 2017 has been updated and is being provided in this 3rd Request Response as documents: (1) 083\_MENONI CONAGRA T5N-R64W-S30 L01\_Final Signed STEM Plan\_Rev, (2) 083\_MENONI CONAGRA T5N-R64W-S30 L01\_SIGNED EVAL\_rev and (3) 083\_MENONI CONAGRA T5N-R64W-S30 L01\_STEM Engineering Evaluation\_rev1\_correction.

NEI provided a second signed Engineering Evaluation with 4 tanks, 2 of which are headspace tanks. This evaluation is dated 7/13/2018.

**Audit Notes**

Facility walkdown information provided 5/16/2018 in the 2nd Information Request Response titled 059\_MERCURE MCKINLEY T4N-R65W-S8 L01 Facility Walkdown.

The Work Request indicated the oil dump valves on remaining HLP separators were to be modified to Kimray 1400 with 1/2 inch trims. Could not verify the oil dump valve size (2" or 1") on either separator with the documentation provided. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim.

It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

Tank configuration in initial Field Data Walkdown indicates there are 3 - 300 bbl oil tanks. The 4/19/2016 STEM Work Request indicated one tank is to be placed in headspace service. The evaluation is completed with only 2 tanks, one in production service at 90% (equalization height) and the other in headspace service (0%). A data request was sent to Noble to confirm the tank configuration ( 2 tanks on site, 3 tanks on site, the number in vapor headspace service, etc.).

Noble provided information on 11/14/2018 that confirmed the configuration of one (1) vapor headspace tank and two (2) liquid production tanks on this location. Noble also provided an updated signed Engineering Evaluation with a three (3) tank battery configuration with a single (1) vapor headspace tank. The new Engineering Evaluation is documentation the Engineering Design Standard was adequately applied.

**Audit Notes**

**FINDINGS (CAB):**

CB - Item #1 in the Dump Valve Modifications section of the Stem Work Request form requests that the existing 212 dump valves be replaced with 1" 1400 and 1/2" trim. There is no indication in the Job Sheet or documentation in the Final Packet that this work was completed. However item A1 on the STEM Retrofit Walkdown Checklist confirms that the valve trim was changed. The Field Data Sheet showed the #2 separator (HPLP) was originally equipped with a 2" 212 valve with 1/2" trim. The Noble model and signed evaluation used a 1" valve with 1/2" trim for their analysis. Using a 2" valve with 1/2" trim in the SLR model causes a 4% difference in PPIVFR. It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

CB - The Noble STEM model and signed evaluation used a 3" for the VOC header from the tanks to the knock-outs. The Field Data Sheets identify the line size from the tanks to the knock-outs as 2" (pg. 12 of Final Packet). A change from the 2" line to a 3" line is not listed in the Stem Work Request form or the Job Sheet. Additional data was provided in a letter date 3/27/2020 showing that the line was replaced on 2/15/2017.

LOD ID: **MILE HI SHEEP T6N-R64W-S8 L01**

Consent Decree Tank System Number: **609**

**Audit Notes**

The walkdown checklist (MILE HI SHEEP T6N-R64W-S8 L01\_WALKDOWN) was not marked as being complete. Completion was verified through other documentation in the final packet (MILE HI SHEEP T6N-R64W-S8 L01\_FINAL PACKET).

The site sketch (MILE HI SHEEP T6N-R64W-S8 L01\_FINAL PACKET, p 11) lists the oil tank #1 as one of the tanks selected to be removed along with the pit pump (MILE HI SHEEP T6N-R64W-S8 L01\_FINAL PACKET, p 3). Oil tank #2 and Oil tank #3 are listed as 250 bbl. (MILE HI SHEEP T6N-R64W-S8 L01\_FINAL PACKET, p 12). The signed evaluation (MILE HI SHEEP T6N-R64W-S8 L01\_SIGNED EVAL) and the model (MILE HI SHEEP T6N-R64W-S8 L01\_SIGNED EVAL) are both run using 300 bbl. tanks. This will result in an overestimation of PPIVF but an overestimation of surge capacity. The engineering design standard in this case is not strictly applied.

LOD ID: **MILLAGE T4N-R64W-S12 L01**

Consent Decree Tank System Number: **927**

**Audit Notes**

**1. Field Datasheets are not dated**

The Field Datasheets (Final Packet, pg 9-14) are not dated. Date assumed to be same as Facility Scouting Date (11/12/2015).

**2. Tank Equalizer Height**

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line and can therefore not be considered a control method in this case. However, headspace surge capacity was not claimed in the final signed eval and so the Engineering Design Standard can be considered strictly applied.

**Audit Notes**

1. The Work Request, pg. 3, requests the current 212 SMA oil dump valve on the HLP Separator (Millage 12-19) be replaced with a 1" 1400 valve body. As a 2" or 1" valve can accommodate a 1/2" trim, it is unconfirmed which valve body size was installed as there is no provided documentation to confirm the installed oil dump valve body is a 1" make. The HLP Separator dump valve trim size is confirmed as 1/2" per the Walkdown Checklist, Item A1.

NEI 2/20/2018 response to data request:

The Kimray 212 dump valve does not have an adjustable trim and seat, the effective "trim size" is fixed and cannot be modified. If the records positively confirm that the trim size was changed to 1/2", then the 2" Kimray 212 dump valve was replaced with the 1" 1400 valve.

**LOD ID:** **MILLAGE T5N-R64W-S3 L01**

**Consent Decree Tank System Number:** **1148**

**Audit Notes**

The walkdown checklist (MILLAGE T5N-R64W-S3 L01\_WALKDOWN) was not marked as being complete. Completion was verified through other documentation in the final packet (MILLAGE T5N-R64W-S3 L01\_FINAL PACKET)

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

The job sheet (MILLAGE T5N-R64W-S3 L01\_FINAL PACKET, p 21) states the PSHH was set at 65 psig, however the signed evaluation (MILLAGE T5N-R64W-S3 L01\_SIGNED EVAL, p 2), an email from Heidi Figueroa (MILLAGE T5N-R64W-S3 L01\_FINAL PACKET, p 25), and the QC Stem checklist (MILLAGE T5N-R64W-S3 L01\_FINAL PACKET, p 27) state the PSHH is 70 psig. Regardless of which setpoint is correct the modeling guideline was still strictly applied because the pressures are at or below the pressure in the signed eval.

**Audit Notes**

A new LP separator was brought on-site to develop a HP-LP train. Could not verify the oil dump valve size (2" or 1") of the new LP separator. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim.

It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

Consent Decree Tank System Number: **12**

**Audit Notes**

The walkdown checklist (MOBILE PREMIX T6N-R66W-S35 L01\_WALKDOWN) was not marked as being complete. Completion was verified through other documentation in the final packet (MOBILE PREMIX T6N-R66W-S35 L01\_FINAL PACKET).

The STEM work request (MOBILE PREMIX T6N-R66W-S35 L01\_FINAL PACKET, p 3) requests the trims all be updated to 3/8". The job sheet (MOBILE PREMIX T6N-R66W-S35 L01\_FINAL PACKET, p 19) does not mention the trims were updated to 3/8", however the walkdown checklist (MOBILE PREMIX T6N-R66W-S35 L01\_WALKDOWN) A1 indicates the trims all match the signed eval (3/8") (MOBILE PREMIX T6N-R66W-S35 L01\_SIGNED EVAL), but it does not confirm the valve size. A 2" valve was used in the model to be conservative. It is unknown if the modeling guideline was strictly applied.

LOD ID: **MONFORT T5N-R63W-S30 L03**

Consent Decree Tank System Number: **1149**

**Audit Notes**

The final walkdown is not marked as being complete.

It appears the site was modeled incorrectly based upon the information provided. According to the field data sheets (PG 13 of Final Packet pdf) the oil dump valve size was 2" however the work request (PG 3 of Final packet pdf) states the dump valve size was to be changed to 1" with 1/2" trim. The job sheets (PG 20 of Final Packet pdf) verify this task was completed so the site should have been modeled accordingly however the stem engineering evaluation shows the site to have been modeled with a 2" dump valve size with 1/2" trim. The modeling guideline was still strictly applied since the signed evaluation overestimated PPIVF.

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

This site has been selected for IR camera inspection due to high line pressure.

Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **MONTERA T6N-R66W-S11 L01**

Consent Decree Tank System Number: **1502**

**Audit Notes**

The walkdown checklist (MONTERA T6N-R66W-S11 L01\_WALKDOWN) was not marked as being complete. Completion was verified through other documentation in the final packet (MONTERA T6N-R66W-S11 L01\_FINAL PACKET).

The STEM work request (MONTERA T6N-R66W-S11 L01\_FINAL PACKET, p 3) requests the existing HLP separator be replaced with a B-grade 1000# separator and to confirm the oil dump valves to have a 1/2" trim. The Job sheet (MONTERA T6N-R66W-S11 L01\_FINAL PACKET, p 22) confirms the oil dump is a 1" valve with a 1/2" trim. This made for a 4% overestimation in PPIVFR.

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

LOD ID: **MOSER T3N-R65W-S22 L01**

Consent Decree Tank System Number: **434**

**Audit Notes**

The Engineering Evaluation was completed with three oil tanks one of which was a headspace tank and one water tank. There is no work request to create a headspace tank but truck loadout vapor collection system was installed. No documentation is provided to verify that one of the oil tanks was converted to a headspace tank. Noble provided Truck Loadout Installation with a date of 11/9/2015 in response to a data request on 12/10/2018 that confirmed the creation of one headspace tank.

-Note that the 2nd tank in all videos labeled "Work Tank" was not filmed in IR mode.

The engineering evaluation was completed with one lead 48", and one 48" Cimarron combustor. Work Request specified that the existing 48" Cimarron combustor on site was to be connected to the tank VOC header. No documentation was provided confirming this was completed. In response to the data request dated 12/10/2018 Noble verified that a Cimarron 48" HV ECD was connected to tank vapors.

**Audit Notes**

THE WALKDOWN CHECKLIST WAS NOT MARKED COMPLETE.

The work request (pg. 3 FINAL PACKET) states that the #1 oil tank needs to be disconnected from the fill header to be used as a headspace-only tank. There is no verification (pg 13-29 FINAL PACKET) that this was completed.

**NOBLE RESPONSE**

Field verification for this facility was completed on or around 10/5/2018, field verification confirmed that one tank was not converted into a headspace tank.

Consent Decree Tank System Number: **1356**

**Audit Notes**

**Oil Dump Valve Size - Unknown**

Job Sheet (Final Packet, pg 22) and pg 24 of the Final Packet indicate a new LP separator with unknown oil dump valve and trim size was installed onsite . ITEM A1 of the STEM Walkdown Checklist (Final Packet, pg 17) is checked "yes" indicating the oil dump trim size onsite is consistent with the trim size used in the Engineering Evaluation.

A 1" oil dump valve is used in the Engineering Evaluation, no documentation is provided to confirm this valve is installed on the LP separator. For the given trim size, ½", a 2" valve could be installed and therefore the Modeling Guideline cannot be confirmed as being strictly applied. Assuming a 2" valve size on the separator, the modeled results do not show an exceedance of the vapor control system capacity.

**Single Tank Battery**

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

LOD ID: **Norris Pioneer T2N-R64W-S8 L01**

Consent Decree Tank System Number: **1159**

**Audit Notes**

The Walkdown Checklist (NORRIS PIONEER T2N-R64W-S8 L01\_WALKDOWN) was not marked as complete. Completion of the work request was done through other documentation in the final packet (NORRIS PIONEER T2N-R64W-S8 L01\_FINAL PACKET).

Per the Work Request (NORRIS PIONEER T2N-R64W-S8 L01\_FINAL PACKET.pdf, pg. 3) a new LP Separator was to be installed on the site. The Job Sheet (NORRIS PIONEER T2N-R64W-S8 L01\_FINAL PACKET.pdf, pg. 35) confirmed the LP separator was installed, but it does not indicate the oil dump valve size. A1 of the Final Walkdown form (ANDERSON MARLEY NORRIS PIONEER T2N-R64W-S8 L01\_WALKDOWN.pdf, pg. 1) indicates the trim has been verified, but no documentation on the actual valve size. A 2" valve was used in the model to be conservative. It is unknown if the modeling guideline was strictly applied.

This site was selected for an additional IR Camera inspection because it was partly filmed looking directly into the sun.

**Audit Notes**

The walkdown checklist (OCOMA T4N-R65W-S25 L01\_WALKDOWN) was not marked as complete. Completion was verified through other documentation in the final packet (OCOMA T4N-R65W-S25 L01\_FINAL PACKET).

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

**Engineering Evaluation Verification Audit**  
Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **OREDIGGER WILMOTH MCCLINTOCK T4N-R64W-S4 L01**

Consent Decree Tank System Number: **627**

**Audit Notes**

The walkdown checklist (OREDIGGER WILMOTH MCCLINTOCK T4N-R64W-S4 L01\_WALKDOWN) was not marked as being complete. Completion was verified through other documentation in the final packet (OREDIGGER WILMOTH MCCLINTOCK T4N-R64W-S4 L01\_FINAL PACKET).

The signed eval (OREDIGGER WILMOTH MCCLINTOCK T4N-R64W-S4 L01\_SIGNED EVAL) and the STEM model (OREDIGGER WILMOTH MCCLINTOCK T4N-R64W-S4 L01\_STEM Engineering Evaluation\_rev1\_with TLO) indicate the correct VOC burner design was a LEED 48" Gen 1 #7. However according to the Installed Equipment worksheet (OREDIGGER WILMOTH MCCLINTOCK T4N-R64W-S4 L01\_FINAL PACKET, p 35) a Tornado S/N 1159 Burner was installed on the site on 3/8/2016 and the LEED 48" S/N 11305 was removed from the site. These dates are included in the dates listed in the job sheet (OREDIGGER WILMOTH MCCLINTOCK T4N-R64W-S4 L01\_FINAL PACKET, p 33) from 3/7/16 to 3/17/2016, however were not mentioned in the job sheet. A new model was run using the Tornado burner (OREDIGGER WILMOTH MCCLINTOCK T4N-R64W-S4 L01\_STEM Engineering Eval\_rev2\_RA). Both models passed.

The STEM work request form (OREDIGGER WILMOTH MCCLINTOCK T4N-R64W-S4 L01\_FINAL PACKET, p 3) first requests the flowlines for 15.1, and 33 be moved into the HLP separator #2 with well 23 and for the flowline from 69 to be moved to the old 33 HLP, Sep #3. According to the Separator identification from the field data sheet (OREDIGGER WILMOTH MCCLINTOCK T4N-R64W-S4 L01\_FINAL PACKET, p 24), separators #2 & #3 both have 2" SMA valves. It was confirmed that the other 2 separators (1 & 4) were removed from the site according to the job sheet (OREDIGGER WILMOTH MCCLINTOCK T4N-R64W-S4 L01\_FINAL PACKET, p 33). According to the walkdown checklist (OREDIGGER WILMOTH MCCLINTOCK T4N-R64W-S4 L01\_WALKDOWN) A1, the trim sizes were updated to what is stated in the signed eval (1/2") (OREDIGGER WILMOTH MCCLINTOCK T4N-R64W-S4 L01\_SIGNED EVAL). A 2" valve was used in the model to be conservative. It is unknown if the modeling guideline was strictly applied.

The site was selected for an additional IR Camera inspection because the original footage was very shaky.

**Audit Notes**

**Oil Dump Valve Size - Unknown**

Job Sheet (Final Packet, pg 26) indicates a new LP separator with an unknown oil dump valve size and a 1/2" trim size was installed onsite. The Job Sheet confirms a 1/2" trim is installed on the oil dump valve.

A 1" oil dump valve is used in the Engineering Evaluation, no documentation is provided to confirm this valve is installed on the LP separator. For the given trim size, 1/2", a 2" valve could be installed and therefore the Modeling Guideline cannot be confirmed as being strictly applied. Assuming a 2" valve size on the separator, the modeled results do not show an exceedance of the vapor control system capacity.

**Single Tank Battery**

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

**Audit Notes**

THE WALKDOWN CHECKLIST WAS NOT MARKED COMPLETE.

The work request (pg. 3 FINAL PACKET) states that a 4" AGL needed to be installed from the KO to Burner.

There is no verification that the work was completed.( pg. 11-31 FINAL PACKET)

**NOBLE RESPONSE:**

Field verification for this facility was completed on or around 2/22/2017, field verification confirmed that the 4" VOC line from the tank to KO was installed.

Consent Decree Tank System Number: **154**

**Audit Notes**

The walkdown checklist (OSTER T4N-R65W-S27 L03\_WALKDOWN) was not marked as being complete. Completion was verified through other documentation in the final packet (OSTER T4N-R65W-S27 L03\_FINAL PACKET).

The Work Request Form says to replace the LP oil dump with 1" x 3/8". The Job Sheet (Final packet p23) says a Versa Valve was installed, but there was no confirmation that the valve was changed to 1". A 2" valve was used in the model to be conservative. It is unknown if the modeling guideline was strictly applied.

**Audit Notes**

**HLP Separator Operating Pressure**

Field datasheet (Final Packet, pg 15) shows a HLP separator onsite, indicates the HP separator serial number is 36308 and the LP separator serial number is unreadable. This HLP separator is currently onsite today. The QC Stem Checkout form (Final Packet, pg 27) indicates the separator with serial number 36303 was set to a max operating pressure of 55 psi. Given this and that ITEM B3 of the STEM Walkdown Checklist (Final Packet, pg 29) is checked "yes", SLR is assuming 36303 is the serial number of the LP separator onsite, and therefore the QC Stem Checkout form confirms the 55 psi max separator pressure onsite.

**Single Tank Battery**

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

LOD ID: **OTTOSON T7N-R65W-S32 L01**

Consent Decree Tank System Number: **937**

**Audit Notes**

The walkdown checklist (OTTOSON T7N-R65W-S32 L01\_WALKDOWN) was not marked as being complete. Completion was verified through other documentation in the final packet (OTTOSON T7N-R65W-S32 L01\_FINAL PACKET\_REWORK).

The field datasheet (OTTOSON T7N-R65W-S32 L01\_FINAL PACKET\_REWORK, p14) does not list the diameter of the VOC line from the KO to the burners. The signed eval (OTTOSON T7N-R65W-S32 L01\_SIGNED EVAL\_REWORK) lists the diameter as 3". The data request from 12/10/2018 confirmed the VOC line from the KO to the burners is 3" in diameter.

According to the job sheet (OTTOSON T7N-R65W-S32 L01\_FINAL PACKET\_REWORK, p 20) a new 300# separator was added to the site. However there was no documentation of the valve or trim size. A1 from the walkdown checklist (OTTOSON T7N-R65W-S32 L01\_WALKDOWN) confirms a 1/2" trim was installed. A 2" valve was used in these calculations to be conservative. It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

The walkdown was completed on 9/28/2015 prior to the rework work request (6/9/2017). The walkdown was only used to verify work requested in the original work request dated 7/30/2015.

**Audit Notes**

The Walkdown Checklist (PATRIOT T5N-R64W-S9 L01\_FINAL PACKET.pdf, pg. 22) did not indicate if all items on the Work Request (PATRIOT T5N-R64W-S9 L01\_FINAL PACKET.pdf, pg. 3) were completed. The site equipment list was verified through other supplied documentation.

The Final Signed Engineering Evaluation (PATRIOT T5N-R64W-S9 L01\_SIGNED EVAL.pdf, pg. 2) indicates the oil tank battery is not banked. However, the Final Facility Walkdown Checklist (PATRIOT T5N-R642-S9 L01\_WALKDOWN.pdf, pg. 5) states the oil tanks are banked in the following configuration, "One bank of 1 oil and one bank of 3 oil". Data request from 2/20/2018 confirmed there is no banking at the site.

This site was selected for an additional IR Camera inspection because there are no clear shots of the thief hatches.

**Audit Notes**

**Oil Dump Valve Size**

Field Datasheet (Final Packet, pg 9 & 21) shows the separators onsite originally had 1" oil dump valves with various trim sizes. The STEM Work Request form (Final Packet, pg 5) requests all oil dump valve trim sizes be replaced with 3/8" trims. The Jobsheet (Final Packet, pg 32) notes the trims were changed out to 3/8", but just to the right of this note there appears to be another note which appears to say "not yet". This note possibly means the valve trims were not yet changed to 3/8" at the time this jobsheet was created. However ITEM A1 of the STEM Walkdown Checklist (Final Packet, pg 29) is checked "yes", indicating the oil dump is consistent with the Engineering Evaluation and are therefore 3/8" trims.

All oil dumps valve sizes were previously 1". These oil dump valve sizes have not been modified and therefore 1" oil dump valves are installed on the separators currently.

Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **PEDRO ST T4N-R65W-S36 L01**

Consent Decree Tank System Number: **682**

**Audit Notes**

**1. Field Datasheets are not dated**

The Field Datasheets (Final Packet pg 12-17) are not dated. Assumed the date is the same as Facility Scouting date (4/12/16).

**2. Oil Tank not converted to Vapor Space Tank onsite - Engineering Design Standard not followed**

The STEM Work Request (Final Packet pg 3) requests a tank to be disconnected from the fill header and to be emptied and used as a vapor surge vessel. Check C13 of the STEM Walkdown Checklist (Final Packet pg 7) indicates the LP separator(s) are configured to produce into all tanks and the Job Sheet (Final Packet pg 26) does not indicate an oil tank was emptied and put into vapor service. The documentation indicates an oil tank was never put into vapor service and therefore the Engineering Design Standard was not followed.

**5/14/2018 UPDATE** - Noble provided SLR information noting field verification for this facility was completed on or around 2/26/2018, and confirmed one oil tank was converted into a headspace tank. Therefore the Engineering Design Standard is being followed.

**3. Five oil tanks originally onsite, Job Sheet indicates one oil tank was removed twice**

STEM Work Request (Final Packet pg 3) requests a oil tank be disconnected and removed from service. The Job Sheet (Final Packet pg 26) indicates twice that production tank (SN: 12-1977) was removed. Assume the Foreman who filled out the Job Sheet accidentally wrote the same info twice.

**4. Number of VOC lines from Tanks to KO not consistent in documentation - Engineering Design Standard not followed**

Aerial Photo (Final Packet pg 9) shows two separate VOC lines from Tanks to KO. STEM Work Request (Final Packet pg 3) requests the VOC header on the top of the tanks be modified so there is a single line down to the KO pot. The Job Sheet (Final Packet pg 26) nor any other documentation shows a single line from tanks to KO was ever installed onsite, therefore the Engineering Design Standard was not followed.

**5. Unable to determine KO to burner VOC line size - Request additional data from Noble**

Field Data Sheets (Final Packet pg 16) show that a 2" below ground VOC line (BGL) from KO to burners existed previously onsite. The STEM Work Request (Final Packet pg 3) indicates a 4" above ground VOC line (AGL) was requested to be connected to the burner onsite. The only documentation provided which may indicate the 4" AGL line was installed is the Cost Estimate (Final Packet pg 8) which indicates a 3" or 4" AGL was priced out and check A7 on the STEM Walkdown Checklist (Final Packet pg 5) indicates piping support has been installed hinting that a VOC AGL was installed onsite. The Job Sheet and other provided documentation does not indicate the VOC BGL was ever abandoned onsite. Given the above information it cannot be determined if a 4" KO to burners VOC line is onsite.

**Request data from Noble to show a 4" KO to VOC line is currently onsite**

**5/14/2018 UPDATE** - Noble provided SLR information noting field verification for this facility was completed on or around 6/21/2016, and confirmed the above ground 4" vapor line was installed onsite.

**6. Number of LP Separators documented onsite**

The STEM Work Request (Final Packet pg 3) indicates a request was made for the existing G36-18 (SN: 8476) separator to be converted to the LP Separator. The Job Sheet (Final Packet pg 26) does not confirm the G36-18 HP separator was ever converted to an LP separator. The QC Stem Checkout (Final Packet pg 24) shows there is only one separator onsite (SN: 8476) and it is operating at the correct pressure. Therefore the QC STEM Checkout confirms one LP separator onsite which dumps to the oil tanks.

LOD ID: **PEDRO ST T4N-R65W-S36 L03**

Consent Decree Tank System Number: **1928**

**Audit Notes**

**1. Field Datasheets are not dated**

The Field Datasheets (Final Packet, pg 13-18) are not dated. Date assumed to be same as Facility Scouting Date (2/26/2016).

**2. Vapor Surge Vessel - Request additional information**

The Engineering Evaluation indicates (1) vapor surge vessel is currently onsite. In the Noble provided data, no documentation is present to indicate a vapor surge vessel was onsite previously or that an oil tank onsite was converted to a vapor surge vessel at any point.

**Confirm an oil tank was converted to a vapor surge vessel onsite.**

**NOBLE UPDATE: The Tank Truck Loadout Final Packet (provided in this 6th Information Request Response titled 239\_PEDRO ST T4N-R65W-S36 L03 TLO Final Packet) dated 2/7/2017, provides confirmation that one tank was converted into a headspace tank.**

**3. Oil Dump Valve Size - Unknown**

Field Datasheet (Final Packet, pg 16) shows the LP separator onsite originally had a 2" oil dump valve with unknown trim size. ITEM A1 of the STEM Walkdown Checklist is checked "yes" indicating the oil dump trim size onsite is consistent with the trim size used in the Engineering Evaluation, and is therefore 1/2".

A 1" oil dump valve is used in the Engineering Evaluation, no documentation is provided to confirm this valve was/is installed on the LP separator. For the given trim size, 1/2", a 2" valve could be installed and therefore the modeling guideline cannot be confirmed as being followed. Assuming a 2" valve size on the separator, the modeled results do not show an exceedance of the vapor control system capacity.

## Engineering Evaluation Verification Audit

Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **PEPERZAK T6N-R64W-S12 L01**

Consent Decree Tank System Number: **1671**

### Audit Notes

A Work Order request was issued to "bottom out" one oil tank; remove the oil fill line from the tank while keeping the tank connected to the VCS in order to be utilized as head space only. The accompanying Job Sheet did confirm the tank was "bottomed out" and the Walkdown Checklist was not checked as complete to "Confirm all the items on the work request form have been completed." Additionally, the provided STEM Retrofit Walkdown Checklist, Item C13, was checked "yes" indicating all tank fill lines are configured to enable LP separators to produce into all tanks.

Additional information is requested to determine if a tank was converted to vapor headspace service and the Engineering Design Standard was properly applied.

NEI Data Request Response:

Field verification for this facility was completed on or around 2/10/17, field verification confirmed that one tank was disconnected from the fill header in order to be used as headspace.

The Work Request indicated the oil dump valve on the HPLP Separator was to be modified to Kimray 1400 with 1/2 inch trims. Could not verify the oil dump valve size (2" or 1") on the separator with the documentation provided. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim.

It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

## Engineering Evaluation Verification Audit

Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **PETERSON T8N-R59W-S19 L01**

Consent Decree Tank System Number: **1919**

### Audit Notes

There is no confirmation in the documents that the Tank Level Automation for the tanks was installed and set to shut in wellheads when the tanks are 50% full as stated in the STEM Work Request Form. Received e-mail confirmation via data request that the Tank Level Automation was installed and set to shut in wellheads when the tanks are 50% full

It appears that the Cv or Cf used in SLR's calculations are slightly different than those used by Noble for the working and flash emissions. This causes a slight difference (-1%) in the calculated PPIVF results. It appears that Noble over estimated the emissions so the modeling guideline is still being followed.

LOD ID: **PETTINGER USX T7N-R64W-S35 L01**

Consent Decree Tank System Number: **1491**

**Audit Notes**

**Oil Dump Valve Size - Unknown**

The Jobsheet (Final Packet, pg 20) confirms a new LP separator was installed onsite and that a 1/2" oil dump trim is installed on the separator.

A 1" oil dump valve is used in the Engineering Evaluation, no documentation is provided to confirm this 1" valve was/is installed on the LP separator. For the given trim size, 1/2", a 2" valve could be installed and therefore the Modeling Guideline cannot be confirmed as being strictly applied. Assuming a 2" valve size on the separator, the modeled results do not show an exceedance of the vapor control system capacity.

**Audit Notes**

The Work Request indicated the oil and water dump valve trims were to be confirmed as 1-inch trim and 1/2-inch trims, respectively. The Job Sheet confirmed orifice plates of the corresponding trim size were installed on the dump valves. The oil and water dump valve size on the heater treater is unknown with the documentation provided. Conservatively assumed the valve to be 2", which corresponds with the separator oil dump valve.

NEI Data Request Response:

The specific valve size/type is not a critical aspect of the design. Field verification of the valve size would not impact the adequacy of design determination, as the typical design targets 20-30% contingency.

**Audit Notes**

**1. Facility walkdown checklist inconsistencies**

The STEM Work Request (Final Packet, pg 3) requests an oil tank be disconnected from the fill header and converted to a vapor headspace tank. The Job Sheet (Final Packet, pg 23) indicates an oil tank was converted into a vapor headspace tank. Item C13 of the STEM Walkdown Checklist (Final Packet, pg 7) is checked "yes", indicating LP separators can produce into all tanks.

Given this inconsistency, the Walkdown Checklist has not been used as confirmation of changes on site.

**2. Separator maximum operating pressure discrepancy**

The Job Sheet (Final Packet pg 23) indicates the separator maximum operating pressure was set to 50 psig. The STEM Work Request form (Final Packet pg 3) and Automation Email (Final Packet pg 22) indicate the separator maximum operating pressure was set to 70 psig. The Signed Evaluation used 70 psig and would overestimate the actual PPIVFR if the set point were in fact 50 psig.

**3. Field Datasheets are not dated**

The Field Datasheets (Final Packet pg 13-18) are not dated, no facility scouting date included. Date assumed to be prior to STEM Work Request Form date (12/10/2015).

Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **RAYGLO T6N-R64W-S14 L01**

Consent Decree Tank System Number: **591**

**Audit Notes**

The walkdown checklist (RAYGLO T6N-R64W-S14 L01\_WALKDOWN) was not marked as being complete. Completion was verified through other documentation in the final packet (RAYGLO T6N-R64W-S14 L01\_FINAL PACKET).

The Field datasheet (RAYGLO T6N-R64W-S14 L01\_FINAL PACKET, p 4 & 6-7) has a total of 17 oil tanks and 4 water tanks. The Walkdown checklist (RAYGLO T6N-R64W-S14 L01\_WALKDOWN, p 4) lists 2 banks of tanks, each only consisting of 10 tanks. The model was run with a bank of 9 oil tanks and 2 water tanks to be conservative. The signed evaluation from 12/10/2018 confirms the correct bank.

The STEM work request (RAYGLO T6N-R64W-S14 L01\_FINAL PACKET, p 3) requests the dump valves be changed to 3/4" trim. The Job Sheet (RAYGLO T6N-R64W-S14 L01\_FINAL PACKET, p 24) does not mention any dump valves were replaced. A1 of the STEM RETROFIT WALKDOWN CHECKLIST (RAYGLO T6N-R64W-S14 L01\_FINAL PACKET, p 16) confirms the oil dump trims were consistent with the engineering evaluation, and therefore assumed to be 3/4" (RAYGLO T6N-R64W-S14 L01\_SIGNED EVAL, p 2). New Signed Eval document from 12/10/2018 confirms the oil dump valves have been changed to 3/4".

**Audit Notes**

- The final walkdown is not marked as being complete.
  
- The Work Request indicated the oil dump valve on the separator was to be modified to Kimray 1400 with 1/2 inch trim. Could not verify the oil dump valve size (2" or 1") on either separator with the documentation provided. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim. It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.
  
- There is no documentation that the 2" VCS line from the tank to the KO was changed to 3". On 5/16/2018 Noble responded that field verification confirming the line was changed.

LOD ID: **REI FED BEEBE DRAW OVIATT T3N-R65W-S10 L01**

Consent Decree Tank System Number: **435**

**Audit Notes**

The Walkdown checklist was not marked as being completed. The site was verified through other supplied documentation in the final packet.

The stem work request (REI FED BEEBE DRAW OVIATT T3N-R65W-S10 L01\_FINAL PACKET, p 3) requests that the existing 212 dump valve be replaced with a 1" 1400 with a 1/2" trim. However, the job sheet (REI FED BEEBE DRAW OVIATT T3N-R65W-S10 L01\_FINAL PACKET, p 23) does not confirm the new valve size. A1 from the walkdown checklist (REI FED BEEBE DRAW OVIATT T3N-R65W-S10 L01\_WALKDOWN, p2) confirms the 1/2" trim size, but not the valve size. A 2" valve was used in the model to be conservative. It is unknown if the modeling guideline was strictly applied.

The work request lists converting tank #4 to a headspace tank. The job sheet in the final packet did not verify this action was completed. In response to a data request dated 8/14/2018 Noble stated that "Field verification for this facility was completed on or around 5/11/16, field verification confirmed that tank #4 was converted into a headspace tank (i.e. removed from liquid service but remained connected to vapor header)."

Field datasheet in the final packet states a Cimarron 48" was installed. The Signed Eval uses a Cimarron 48 HV. A Cimarron 48 has a much lower capacity than a 48 HV. In response to a data request dated 8/14/2018 Noble stated that "Field verification for this facility was completed on or around 6/6/2016. Field verification confirmed that the model of the control device installed for the oil tank VCS is the Cimarron 48 HV."

The site was selected for an additional IR Camera inspection because the footage is very shaky.

**Audit Notes**

-A new HP separator was brought on-site to replace a HP-LP train. Could not verify the oil dump valve size (2" or 1") of the new LP separator. Conservatively assumed the valve to be 2", the larger available size for 3/8" trim. It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

-The work request stated that the 2" VOC line from the tanks to KO was to be replaced with a 3" line. No documentation was provided to confirm this was completed. In response to a data request Noble stated "Field verification for this facility was completed on or around 3/1/2017, field verification confirmed that the 3" VOC line from the tanks to KO was installed"

**Audit Notes**

The Work Request indicated the oil dump valves on both HLP Separators were to be modified to Kimray 1400 with 1/2" trims. Could not verify the oil dump valve size (2" or 1") on either separator with the documentation provided. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim.

It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

The Work Request indicated the automated PSHH for both HLP Separators was to be set to 70 psig triggering a wellhead shut-in. No confirmation provided in initial documentation that the setpoint was implemented for the separators.

Noble provided information on 11/14/2018 indicating "Automation verification for this facility was completed on or around 1/11/2018, automation verification confirmed that the PSHH setting on the LP Separators was set at no higher than 70 psig." The Modeling Guidance was determined to be correctly applied for the separator maximum operating pressure based on the provided automation verification information.

LOD ID: **REISTAD T4N-R64W-S5 L01**

Consent Decree Tank System Number: **795**

**Audit Notes**

The walkdown checklist (REISTAD T4N-R64W-S5 L01\_WALKDOWN) was not marked as being complete. Completion was verified through other documentation in the final packet (REISTAD T4N-R64W-S5 L01\_FINAL PACKET).

The STEM work request form (REISTAD T4N-R64W-S5 L01\_FINAL PACKET, p 3) requested the existing 2" 212 valve (REISTAD T4N-R64W-S5 L01\_FINAL PACKET, p 13) be replaced with a 1" 1400 valve with a 1/2" trim. Item A1 of the Walkdown Checklist confirms the oil trim sizes are consistent with the STEM Evaluation. However, there is still no confirmation of the oil valve size. A 2" valve was used in the model to be conservative. It is unknown if the modeling guideline was strictly applied.

Item B3 of the Walkdown Checklist confirms that the PSHH for the LP separator is installed and set according to the design. Additionally, the L.P. Header Standard Design 125# drawing depicts the design to include a Fisher 4660 and Versa Valve downstream of the PSHH. Updated the Audit Checklist tab with the pressures specified in the Work Request form and used in the Signed Eval.

The documentation shows that initially, there was only one combustor on site (Leed) used for condensate tank vapor combustion. The Work Request form specified that the Leed burner be removed. Removal was not confirmed in the documentation. The Work Request form specified the installation of one new Leed EC48-2S (LP header combustor), and one Cimarron 48HV (tank vapor combustor). The installation of both combustors is confirmed in the Job Sheets (pg. 12/25 of the Final Packet). Google Earth photos of the site (in 2016 and 2017) confirm there are two combustors on site. Although the removal of the existing Leed combustor was not confirmed in the documentation, the installation of the two requested combustors is confirmed. The Signed Eval confirms the use of the installed Cimarron 48HV for tank vapor control as specified in the Work Request form. No additional information is needed for the combustors.

**Audit Notes**

The NEI evaluation accounted for oil dumps from a single separator. The initial Field Data Collection information as well as the Signed Evaluation indicate there are two HP separators on site capable of dumping liquids to the storage tanks. In a letter response to the draft audit report on 3/27/2020 Noble stated that "Noble confirmed accuracy of the existing Engineering Evaluation. While it is accurate that there are two separator trains capable of dumping liquids to the storage tanks, the work request and Engineering Evaluation specify that wellhead automation be used to limit separator operation to one separator at a time." Given this information it has been determined that the modeling guideline for this facility has been applied correctly

The separators on location have pressure controlled by pneumatic controllers. The initial provided documentation did not confirm the controller shut-in pressure for the HP Separator was set to 140 psig as requested in the STEM Work Request dated 5/17/2016.

The separator pneumatic PSHH is set by the operator, not automation personnel, and therefore no QA/QC checklist was provided to confirm the maximum pressure of the separator. The STEM One-Pager states the separator cannot operate above 140 psig and was posted on location via Walkdown Checklist Item A14. This serves as confirmation of administrative controls in place to keep the separator below the maximum pressure used in the Engineering Evaluation. It was determined the Modeling Guidelines were appropriately applied based on the administrative use of the One-Pager.

LOD ID: **RITCHEY T3N-R65W-S27 L03**

Consent Decree Tank System Number: **411**

**Audit Notes**

The signed eval and stem engineering evaluation show the site to have been modeled with two (2) headers from tank to KO however all of the data provided within the final packet show only one (1) header from tank to KO to exist.

The Engineering Design Standard was not followed, however, the VCS capacity is adequate during peak flow conditions using a single header.

**Audit Notes**

**Vapor Surge Vessel**

Noble confirmed via data request received on 12/10/2018 that field verification for the facility was completed on or around 2/23/2016 and confirmed that one (1) tank was converted to a headspace tank.

**Oil Dump Valve and Trim Size**

The STEM Work Request (Final Packet, pg 3) indicates it was requested the 270# separator previously onsite be converted to LP separator. The Job Sheet (Final Packet, pg 22) indicates the site was converted to HP/LP setup, the separator with SN 7628 was converted to LP separator. This separator previously had a 1" oil dump valve with 1" trim.

ITEM A1 of the STEM Walkdown Checklist is checked "yes" indicating the oil dump trim size onsite is consistent with the trim size used in the Engineering Evaluation, and is therefore 1/2".

**1. Unable to verify size of tank VOC line to knockout**

The Field Datasheet (pg 13 of Final Packet) indicates the existing tank VOC line to the knockout (KO) is 2". The STEM work request (pg 3 of Final Packet) and Signed Eval indicate this was to be changed to a 3" line. No indication that this line was modified 3" was observed in the documentation provided by Noble.

*Request data from Noble to verify the size of the tank VOC line currently onsite.*

*Update 8/13/2018 - Noble confirms a 3" tank to KO VOC line is onsite.*

**2. Unable to verify separator dump valve size**

The STEM work request (pg 3 of Final Packet) indicates the existing 2" separator dump valve be replaced with a 1" valve and 1/2" trim. The Job Sheet (pg 23 of Final Packet) provides confirmation a 1/2" trim was installed. However, no indication the existing 2" valve was changed to a 1" valve was observed and therefore the modeling guideline is not being met. (It was noted the modeled VCS capacity remains sufficient for a 2" valve size)

**3. Separator PSHH pressure setting discrepancy (overly conservative - no issue with engineering design)**

The Job Sheet (pg 23 of the Final Packet) indicates the pneumatic PSHH was set to 50 psig. An email from the automation consultant (pg 22 of the Final Packet) indicates the separator maximum pressure was set to 60 psig. The Engineering Design (Signed Eval) was run using the more conservative set point pressure of 60 psig.

**4. Field Datasheets are not dated**

The Field Datasheets (Final Packet pg 12-19) are not dated. Assumed the date is the same as Facility Scouting date (8/15/16).

Consent Decree Tank System Number: **278**

### Audit Notes

The signed evaluation states that the VOC line size from the tank to the KO should be 2". There is not a request to change the line size in the work request (FINAL PACKET p. 3), and there is no way to verify what the original line size was due to the tank field datasheet being marked N/A where this information is usually found (FINAL PACKET p.11)

**Audit Notes**

AA - The final packet does not have a work request or job sheet.

CB - It appears that no Work Request Form or Job Sheet was provided because no work was required or performed. See page 2/16 of the Final Packet. The comments state "Current site configuration meets STEM requirements.". Additionally, the Facility Waldown/Start-up section states "not required".

CB - In the Equipment and Process tab the question "Is the number of separators that dump to the tanks correct?" has a value of "Unknown". In Noble's STEM evaluation the HP separator water leg is shown to dump to the tanks, the oil and water legs of the LP separator is shown to dump to the tanks. This configuration represents a reasonable maximum number of dumps and pressures configured to the tanks and controlled by the VCS. Therefore, no additional information is needed to confirm.

CB - In the Equipment and Process tab the question "Are truck loading vapor collection lines installed?" is answered "No". I changed the answer to "Yes" since both the signed evaluation and Noble's STEM Engineering Evaluation model indicate TLO is installed and accounted for in the PPVIFR.

**Audit Notes**

There is some conflicting data regarding the pressure setting of the HP separator. Pressure settings of 60 psig and 65 psig can be verified to have been used throughout the provided documentation. However, the work request asked for the pressure to be set at no higher than 60 psig, and there is documentation verifying the pressure setting at 60psig took place after the pressure setting at 65 psig, therefore it was decided to use 60 psig as the pressure setting for this evaluation.

Consent Decree Tank System Number: **277/2271**

**Audit Notes**

NEI Engineering Evaluation was completed with a maximum operating pressure of 60 psig. An e-mail from the automation group dated January 15, 2016 indicates the LP separator pressure switch was set to 70 psig. Noble provided additional data confirming the PSHH was set to 60 psi in response to the draft audit report.

The Work Request indicated the oil dump valves were to be modified with 1/2 inch trims. The dump valve size on the Roth A 30-7 (LP Separator) was a 2 inch valve. The Engineering Evaluation was completed with this valve as a 1 inch with a 1/2 inch trim. No documentation provided to confirm a change in the valve size (from 2 inch to 1 inch). Conservatively assumed the valve to be 2", the larger available size for 1/2 inch trim.

It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

Consent Decree Tank System Number: **275**

**Audit Notes**

The walkdown checklist was not marked as being complete. Completion was verified through other documentation in the final packet.

Oil Dump Valve and Signed Eval: The Signed Evaluation document indicates a 1/2" trim valve. Noble's STEM Engineering Evaluation workbooks shows a 2" valve with 1/2" trim was used in their calculation. Documentation in the Final Packet indicates the oil dump valve on the LP separator is 1" with 1/2" trim. Noble's run using a 2" oil valve with 1/2" trim is conservative and the modeling guideline is still considered strictly followed.

**Audit Notes**

The Walkdown Checklist (RURAL T4N-R65W-S31 L01\_WALKDOWN.pdf, pg. 4) was not marked as being complete. Completion of the Work Request was verified through other documentation in the Final Packet.

The signed evaluation (RURAL T4N-R65W-S31 L01\_SIGNED EVAL, p 2) states the fill level was 68%. It also states that 1 of the 3 tanks was "disconnected from fill header to be used as headspace only." The fill max should be set to 60% instead of 68%. The STEM model was run at 60% in the final packet and 68% in the STEM model in the final packet (RURAL T4N-R65W-S31 L01\_FINAL PACKET, p 11). The engineering design standard was still strictly followed since the evaluation underestimated actual headspace surge capacity.

The field data sheet (RURAL T4N-R65W-S31 L01\_FINAL PACKET, pg 15) does not show the valve or trim size for Separator 2, the new LP separator. A1 of the walkdown checklist (RURAL T4N-R65W-S31 L01\_WALKDOWN) confirms the trim to be 1/2. A 2" valve was used in the model to be conservative. It is unknown if the modeling guideline was strictly applied.

The site was selected for an additional IR Camera inspection because the camera panned over the site very quickly, making it difficult for visual inspection.

**Audit Notes**

The walkdown checklist was not marked as being complete. Completion was verified through other documentation in the final packet.

The STEM Work Request Form on page 3 of the Final Packet asked that LP oil dump valve trims be confirmed to be 1/2". There is no confirmation in the Job Sheet on page 21 of the Final Packet. Item A1 of the Walkdown Checklist form indicates that all oil dump valve trim sizes are consistent with the design.

Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **SANDAU BARTLES T4N-R66W-S25 L02**

Consent Decree Tank System Number: **163**

**Audit Notes**

Signed evaluation (SANDAU BARTLES T4N-R66W-S25 L02\_SIGNED EVAL, p. 2) indicates use of a Leed 48" Gen 1 #7 combustor but work request (SANDAU BARTLES T4N-R66W-S25 L02\_FINAL PACKET.pdf, p. 3) shows a Leed EC48-2S. Conservatively assumed a Leed EC48-2S is installed.

Work request (SANDAU BARTLES T4N-R66W-S25 L02\_FINAL PACKET.pdf, p. 3) and QC Stem Checkout (SANDAU BARTLES T4N-R66W-S25 L02\_FINAL PACKET.pdf, p. 22) indicate that separator PSHH is set to 65 psig but jobsheet (SANDAU BARTLES T4N-R66W-S25 L02\_FINAL PACKET.pdf, p. 17) shows PSHH installed at 55 psig. Assuming separator was set at 65 psig.

NEI Evaluation was completed with one of the two tanks out of service as additional headspace. The jobsheet indicates the tank was disabled from receiving liquids while remaining connected to the VCS, but the walkdown checklist indicates all tanks are capable of receiving liquid production. Need verification whether tank is vapor service only or capable of receiving production liquids.

NEI Data Request Response:

Field verification for this facility was completed on or around 2/16/17, field verification confirmed that one tank was converted into a headspace tank (i.e. removed from liquid service but remained connected to vapor header).

The Work Request indicated the oil dump valve on HPLP Separator was to be modified to Kimray 1400 with 1/2 inch trims. Could not verify the oil dump valve size (2" or 1") on the separator with the documentation provided. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim.

It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

### Audit Notes

While the field data sheets verify the size of the dump and trim to be 2" & 1", respectively, the site, according to the signed eval and stem engineering design verify the site was modeled with a 1" dump valve with 1/2" trim. While the documented data is conflicting it is safe to say the site evaluation is fine as is with SLR modeling the site with a 2" dump and 1" trim, the PPIVF is still well below the total VCS capacity. Noble provided additional information in a letter dated 3/27/2020 that confirms the dump valve trim size to be 1/2". the valve size in the engineering evaluation still differs from the field data sheets.

Valve on site is larger than in Evaluation. Noble underestimated PPIVFR, Modeling Guideline not followed, but VCS capacity is adequate.

**Audit Notes**

Tanks are in a banked configuration. Noble calculations do not account for breathing from non-producing bank. Modified audit spreadsheet to accommodate a banked configuration for breathing losses and surge capacity for one bank of 6-300 bbl oil tanks and one bank of 3-300 bbl oil tanks and 3-300 bbl water tanks.

LOD ID: **SATER T4N-R63W-S19 L01**

Consent Decree Tank System Number: **1396**

### Audit Notes

A new LP separator was brought on-site to develop a HP-LP train. Could not verify the oil dump valve size (2" or 1") of the new LP separator. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim.

It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

A Work Order request was issued to "bottom out" one oil tank; remove the oil fill line from the tank while keeping the tank connected to the VCS in order to be utilized as head space only. The accompanying Job Sheet did not confirm the tank was "bottomed out" and the Walkdown Checklist was not checked as complete to "Confirm all the items on the work request form have been completed." Additionally, the provided STEM Retrofit Walkdown Checklist, Item C13, was checked "yes" indicating all tank fill lines are configured to enable LP separators to produce into all tanks.

#### NEI Data Request Response:

Field verification for this facility was completed on or around 7/22/16, field verification confirmed that one tank was converted into a headspace tank (i.e. removed from liquid service but remained connected to vapor header).

Possible emissions from PRV at ~1:10 in Normal IR video (SATER T4N-R63W-S19 L01\_1455\_NORMAL).

Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **SATER USX T4N-R63W-S19 L01**

Consent Decree Tank System Number: **1465**

**Audit Notes**

Tank burner size not confirmed in documentation. Assuming 48" size which is typical of Noble facilities and consistent with Signed Evaluation.

No confirmation that tank 1 was taken out of liquid service to be used as a vapor headspace tank.

Noble's response: Field verification for this facility was completed on or around 7/22/16, field verification confirmed that one tank was converted into a headspace tank (i.e. removed from liquid service but remained connected to vapor header).

Field data sheets indicate only one of the two oil tanks is connected to the VCS. If this is the case, one tank can not be utilized as headspace as it is not connected to the VCS. Need to confirm whether or not the tank is connected to the VCS system.

Noble's response to data request: An engineering review of this facility was completed on or around 5/17/2018, this review confirmed that stock tank no. 2 is connected to the VOC System.

The Engineering Evaluation was completed with one (1) 300 bbl oil tank limited to 45% full. Confirmation is needed on control methods for limiting a single oil tank to 45% capacity, if indeed only one tank is connected to the VCS.

Noble's response to data request: An engineering review of this facility was completed on or around 7/12/2018, this review confirmed that stock tank no. 1 is a headspace tank and therefore limits stock tank no. 2 to 45% capacity. The initial walkdown showed stock tank no. 2 was disconnected from the vapor control system. The work request states to turn stock tank no. 2 into a headspace tank, however stock tank no. 1 was converted into the headspace tank. Stock tank no. 2 was reconnected to the vapor control system and is producing and stock tank no. 1 is the headspace tank.

The Modeling Guidelines has not been strictly applied because the breathing losses have not been fully captured in the PPIVFR as the Engineering Evaluation was completed with 1 tank.

**Audit Notes**

The separator pneumatic PSHH is set by the operator not automation and therefore no QA/QC checklist was provided to confirm the maximum pressure of the separator. The STEM One-Pager states that the separator cannot operate above 70 psig and was posted on location via item A14 of the Walkdown Checklist. This serves as confirmation of administrative controls in place to keep the separator below the maximum pressure used in the Engineering Evaluation.

Noble did not account for banked tanks in Engineering Evaluation spreadsheet.

The Engineering Evaluation is completed with "doubled-up" entries for the HP water, and LP water dump rates. The peak dump rates correspond to a single separator dump rate and not rate which is "doubled-up" as indicated on the Certification Report. Because the peak dump rates are underestimated, the Modeling Guideline has not been strictly applied.

**Audit Notes**

The Walkdown Checklist (SCHAEFER DINNER T4N-R66W-S13 L01\_WALKDOWN.pdf, pg. 4) did not indicate if all the items on the Work Request form had been completed. Completion of the Work Request was verified through other documentation in the Final Packet.

The Work request in the final packet requests that the dump valve get replaced with a 1" valve and a 1/2" trim. (SCHAEFER DINNER T4N-R66W-S13 L01\_FINAL PACKET, p 3). The job sheet states that the trim was replaced to be 1/2", but there was no documentation proving the valve was changed from 2" to 1" (SCHAEFER DINNER T4N-R66W-S13 L01\_FINAL PACKET, p 35) . A 2" valve was used in the model to be conservative. It is unknown if the modeling guideline was strictly applied.

This site was selected for an additional IR Camera inspection because the original footage was dark, shaky, and at some points, blurry.

LOD ID: **SCHMIDT T4N-R65W-S19 L03**

Consent Decree Tank System Number: **833**

**Audit Notes**

The field data sheets (PG 12 of FINAL PACKET pdf) verify the VOC line from tank to KO to be 2" while the stem design form (PG 8 of Final Packet pdf), signed eval, and stem engineering evaluation show that line to be 3". Nowhere in the work request does it state the line was to be changed from 2" to 3" nor does it state in the job sheets that work was completed on the VOC line from tank to ko to change from 2" to 3".

LOD ID: **SCHMIDT T4N-R66W-S25 L01\_SIGNED EVAL**

Consent Decree Tank System Number: **158**

**Audit Notes**

The walkdown checklist (SCHMIDT T4N-R66W-S25 L01\_WALKDOWN) was not marked as being complete. Completion was verified with other documentation in the final packet (SCHMIDT T4N-R66W-S25 L01\_FINAL PACKET).

As per the STEM work request form (SCHMIDT T4N-R66W-S25 L01\_FINAL PACKET, p 3) the existing 212 HLP LP oil dump valve was to be replaced with a 1" 1400 with 1/2" trim. The Job sheet does not confirm that the valve was replaced (SCHMIDT T4N-R66W-S25 L01\_FINAL PACKET, p 21). However, the walkdown checklist (SCHMIDT T4N-R66W-S25 L01\_WALKDOWN) A1 confirms that the trim size on the site matches what is in the signed eval (SCHMIDT T4N-R66W-S25 L01\_SIGNED EVAL). Therefore the trim was assumed to be correct and the valve was run as 2" to be conservative. It is unknown if the modeling guideline was strictly applied.

Consent Decree Tank System Number: **124**

**Audit Notes**

The STEM Work Request indicated the 2" VOC line on the top of the oil storage tanks to the KO pot was to be replaced with a 3" line. There is no confirmation that the modification to the Tanks to KO VCS piping was modified to 3".

Noble provided information on 11/14/2018 indicating a "Field verification for this facility was completed on or around 6/5/2017, field verification confirmed that the 3" VOC line from the tank to the KO was installed." The Engineering Design Standard was appropriately applied based on the provided field verification information.

There was no separator information provided in the Field Datasheets. The oil dump valve size (2" or 1") on the LP Separator could not be verified.

It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

**Audit Notes**

The stem work request (PG 4 of Final Packet pdf) states to disconnect and bottom out 1 tank from fill header but leave connected to the VOC header to be used as a headspace tank however nowhere in the job sheets (PGs 23-27 of Final Packet pdf) does it state this task was completed.

Noble provided a response to the above discrepancy on 11/14/2018 that states "Field verification for this facility was completed on or around 11/17/2017, field verification confirmed that one tank was converted to a headspace tank."

LOD ID: **SCHMIDT T5N-R65W-S36 L01**

Consent Decree Tank System Number: **274**

**Audit Notes**

The Engineering Evaluation was completed with 5 - 300 bbl oil tanks and 2 - 300 bbl water tanks tied to the VCS, with one of the tanks utilized as a headspace only tank. The Field Data sheets indicate there are 6 - 300 bbl oil tanks and 2-300 bbl water tanks tied to the VCS. There is no Work Request to remove a tank from service, nor did the Job Sheet indicate a tank was removed from service. The Work Request and Job Sheets only indicate a tank was placed in headspace only service. The Modeling Guideline was not appropriately applied when evaluating with the incorrect number of tanks tied to the VCS.

**Audit Notes**

Job Sheet, pg 19 of Final Packet, indicates a new tank was installed onsite. Provided documentation cannot be found indicating that a new tank was expected to be installed onsite. Pg 10 of the Final packet shows 1 Oil tank already existing onsite. Therefore It could be a possibility 2 Oil tanks are now onsite. IR videos only show 1 tank onsite. Therefore I believe 1 Oil tank onsite is accurate.

STEM work request form, Pg 4 of Final Packet, indicates the existing 2" VOC line from tank to KO is to be replaced with a 3" line. The signed eval also indicates a 3" Tank to KO line size. No documentation is provided showing that a 3" Tank to KO line was ever installed. Request data from Noble to prove 3" Tank to KO line was installed.

**Audit Notes**

The Work Request indicated the oil dump valve on LP Separator was to be modified to 1/2 inch trim. Could not verify this work was completed from the documentation provided. The Modeling Guidance was still correctly applied because the existing trim (1/4") is conservative compared to the 1/2" requested trim.

Confirmed removal of 1 separator (#10445). Separator #10464 confirmed as repurposed to LP. This leaves #10455 and #14009 as being comingled. Based on the documentation provided, it can only be determined that one LP separator dumps to the tanks. The signed eval. model demonstrates 2 LP separators with simultaneous dumps which is conservative and is not a deviation from the modelling guide.

Consent Decree Tank System Number: **2237**

**Audit Notes**

The single oil tank fill level was certified to 90% with equalizer height as the control method. A single tank is unable to limit fill level via equalizer height and must utilize other means (level switch with production shutdown, etc.) for tank level control. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

**Consent Decree Tank System Number:** **379**

**Audit Notes**

The Walkdown Checklist (SCOOTER HORNTON T3N-R64W-S18 L01\_WALKDOWN.pdf, pg. 4) did not indicate if all items on the Work Request form had been completed. Completion of the Work Request was verified through other documentation in the Final Packet.

Per the Work Request (SCOOTER HORNTON T3N-R64W-S18 L01\_FINAL PACKET.pdf, pg. 3) the dump valves on the LP separator were to be replaced with a 1" valve with 1/2" trim. The Job Sheet SCOOTER HORNTON T3N-R64W-S18 L01.pdf, pg 41) does not reference replacement of dump valve or trim. A1 of the walkdown checklist (SCOOTER HORNTON T3N-R64W-S18 L01\_WALKDOWN) confirms the trim was changed to 1/2". A 2" valve was used in the model to be conservative. It is unknown if the modeling guideline was strictly applied.

This site was selected for an additional IR Camera inspection because the original footage did not show the tops of the PRVs above the tanks

Consent Decree Tank System Number: **1202**

**Audit Notes**

The walkdown checklist (SCOOTER T3N-R64W-S18 L02\_WALKDOWN) was not marked as being complete. Completion was verified through other supplied documentation in the final packet (SCOOTER T3N-R64W-S18 L02\_FINAL PACKET).

The STEM work request document (SCOOTER T3N-R64W-S18 L02\_FINAL PACKET, p 3) requests that the 2" VOC line from the tanks to the KO be replaced with 3" lines. There is no documentation to confirm this change was made to the site. The signed evaluation (SCOOTER T3N-R64W-S18 L02\_SIGNED EVAL) uses 3" lines. The model (SCOOTER T3N-R64W-S18 L02\_STEM Engineering Evaluation\_rev1) was run using 3" pipe. The audit used a 2" line to be conservative. Noble provided confirmation in writing on 8/25/2020 that the line was replaced with 3" diameter pipe

The STEM work request document (SCOOTER T3N-R64W-S18 L02\_FINAL PACKET, p 3) requests that the PSHH be set to 65 psig. However, an email from 1/15/2016 (SCOOTER T3N-R64W-S18 L02\_FINAL PACKET, p 24) states the pressure switch was set to 70 psi. The signed evaluation was completed at 65 psig. Noble provided additional information on 3/27/2020 in response to the draft audit report confirming the PSHH was set to 65 psig.

Consent Decree Tank System Number: **629**

**Audit Notes**

The Work Request indicated the oil dump valves on HLP Separators 2 & 3 were to be modified to Kimray 1400 with 1/2 inch trims. Could not verify the oil dump valve size (2" or 1") on either separator with the documentation provided. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim.

It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

A Work Order request was issued to "bottom out" one oil tank; remove the oil fill line from the tank while keeping the tank connected to the VCS in order to be utilized as head space only. The accompanying Job Sheet did not confirm the tank was "bottomed out" and the Walkdown Checklist was not checked as complete to "Confirm all the items on the work request form have been completed." Additionally, the provided STEM Retrofit Walkdown Checklist, Item C13, was checked "N/A" making it unclear as to whether all tank fill lines are configured to enable LP separators to produce into all tanks.

Noble provided information on 11/14/2018 indicating a "Field verification for this facility was completed on or around 3/30/2016, field verification confirmed that one tank was converted to a headspace tank." The Engineering Design Standard has been appropriately applied based on the provided field verification information.

**Audit Notes**

The walkdown checklist (SHABLE T9N-R60W-S33 L01 & SHABLE FED T9N-R60W-S33 L01\_WALKDOWN) was not marked as complete. Completion was verified through other documentation in the final packet (SHABLE T9N-R60W-S33 L01 & SHABLE FED T9N-R60W-S33 L01\_FINAL PACKET).

Tank System consists of two banks of 4 oil, 1 headspace, and 1 water tank each. The signed evaluation did include breathing losses from the non producing bank. The modeling guideline has not be strictly applied.

Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **SHABLE T8N-R60W-S5 L01**

Consent Decree Tank System Number: **2040**

**Audit Notes**

The separators on location have pressure controlled by pneumatic controllers. The initial provided documentation did not confirm the controller shut-in pressure for the HP Separator was set to 175 psig as requested in the STEM Work Request dated 1/29/2016.

The separator pneumatic PSHH is set by the operator, not automation personnel, and therefore no QA/QC checklist was provided to confirm the maximum pressure of the separator. The STEM One-Pager states the separator cannot operate above 175 psig and was posted on location via Walkdown Checklist Item A14. This serves as confirmation of administrative controls in place to keep the separator below the maximum pressure used in the Engineering Evaluation. It was determined the Modeling Guidelines were appropriately applied based on the administrative use of the One-Pager.

**Audit Notes**

A new LP separator was brought on-site to develop a HP-LP train. Could not verify the oil dump valve size (2" or 1") of the new LP separator. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim.

It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

**Audit Notes**

1. Process includes 2 HLPs in operation, however the Final Signed Evaluation notes that only one separator train can operate simultaneously. A response to a data request from Noble dated 11/14/2018 verifies that only 1 separator train can operate at a time.

This Tank system is selected for IR Camera Inspection because the IR footage of the post dump event shows a possible emission release.

LOD ID: **SHELTON T4N-R65W-S24 L01**

Consent Decree Tank System Number: **685**

**Audit Notes**

The work request (p. 3 in final packet) states removal of 1 unused 270 psig HP separator from location. Pages 11 and 14 of the final packet show a total of three (3) separators on site (SN: R0019, R0054, and 8883). The job sheet (p. 21 in final packet) notes that only the 270 psig HP separator (8883) was removed which conflicts with p. 23 which indicates an additional separator (R0019) was removed from site. The final signed evaluation accounts for two separators dumping simultaneously. It is conservative to model two separators dumping simultaneously and thus is not a violation of the Modeling Guideline.

LOD ID: **SHELTON T4N-R65W-S26 L03**

Consent Decree Tank System Number: **1301/1300**

**Audit Notes**

1. The Work Request indicated the oil dump valves on the Separator were to be modified to Kimray 1400 with 1/2 inch trims. The trim size is confirmed by item A1 of the Walkdown Checklist. Could not verify the oil dump valve size (2" or 1") on the separator with the documentation provided. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim. It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.
2. The Work Request indicated the tank VOC line was to be changed to 3". Could not verify this work was done with the provided documentation. Noble provided verbal confirmation on 8/25/2020 that the VOC line was replaced with a 3" diameter pipe.
3. The tank system consists of a single oil tank. The signed evaluation states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.
4. This site was chosen at random for IR Camera Inspection.

**Audit Notes**

The Shoemaker A12-23D separator was not included in the Engineering Evaluation. There is no Work Request to remove it from service, and the Job Sheet did not indicate a separator was removed from service. The automation correspondence from 10/12/15 indicates the A12-23D wellhead is shutdown by the Master at 70 psi, indicating separator is still on location being fed by the well. The Field Data Sheets indicate dumps are produced to Tank 4, which is a tank connected to the VCS.

The Modeling Guidelines have not been correctly applied by leaving the oil and water separator dumps from this unit out of the Engineering Evaluation.

**Audit Notes**

The stem work request form (PG 3 of Final Packet pdf) states for the pneumatic pshh to set the hlp hi/lo at no higher than 55 psig in the LP however nowhere in the job sheets (PGs 22-25) does it confirm this task was completed.

Noble provided a response to the above discrepancy on 11/14/2018 that states "The 'STEM Work Request Form' (Final Packet - page 3), 'STEM Design Confirmation Form' (Final Packet - page 5), the signed 'Vapor Control System Engineering Evaluation' (Signed Eval - page 1), the signed 'Vapor Control System Engineering Evaluation' (Final Signed STEM Plan - page 16), and 'One Pager' (laminated and posted on location) provide consistent documentation that the maximum separator operating pressure was set to no higher than 55 psig as requested. Signature on the Final Packet ensures work was executed per the 'STEM Work Request Form.' "

**Audit Notes**

The Walkdown checklist (SKYWAY T5N-R67W-S11 L02\_WALKDOWN) was not marked as being complete. Completion was verified through other documentation in the final packet (SKYWAY T5N-R67W-S11 L02\_FINAL PACKET).

The Field Datasheet (SKYWAY T5N-R67W-S11 L02\_FINAL PACKET, p 13) confirms the oil tanks on site are 315 bbls. The signed eval (SKYWAY T5N-R67W-S11 L02\_SIGNED EVAL) lists the tanks as 300 bbls. The model was run using 300 bbl tanks to be conservative

Consent Decree Tank System Number: **1989/1279**

**Audit Notes**

The NEI evaluation only accounts for 3 oil tanks, 1 utilized as headspace. Per the Job Sheet and instruction on the marked up aerial, the SLW Green St. tanks were bottomed out (2 tanks in total) and connected to the Vince St VOC header (3 tanks in total).

The provided STEM Retrofit Walkdown Checklist, Item C13, was checked "yes" indicating all tank fill lines are configured to enable the LP separator to produce into all tanks.

Consent Decree Tank System Number: **2026**

**Audit Notes**

The Engineering Evaluation is completed with "doubled-up" or "tripled up" entries for the LP oil, HP water, and LP water dump rates. The peak dump rates correspond to a single separator dump rate and not rate which is "doubled-up" or "tripled up" as indicated on the Certification Report. Because the peak dump rates are underestimated, the Modeling Guideline has not been strictly applied.

The Engineering Evaluation did not include breathing losses from the non-production accepting tank bank. The facility configuration has two banks - one bank with five (5) oil tanks and two (2) water tanks, and another bank with five (5) oil tanks and two (2) water tanks. By excluding the breathing losses from the non-production accepting bank which continues to store oil, the correct application of the Modeling Guidelines cannot be verified.

When the STEM Engineering Evaluation spreadsheet was rerun with new parameters the headspace surge capacity was reduced to more than 1/2 the value in the signed evaluations. For this reason the engineering design standard is considered not to be strictly applied.

LOD ID: **SLW ST PC T5N-R63W-S18 L01**

Consent Decree Tank System Number: **302**

**Audit Notes**

The Tank System consists of 2 banks of 5 oil tanks each. The signed evaluation does not account for breathing losses from the non-producing bank. The modeling guideline has not been strictly applied.

The VCS for the water tanks is separate from the oil VCS so the water VCS does not have to be reviewed.

LOD ID: **SLW T5N-R64W-S10 L01**

Consent Decree Tank System Number: **1211**

**Audit Notes**

The single oil tank fill level was certified to 90% with equalizer height as the control method. A single tank is unable to limit fill level via equalizer height and must utilize other means (level switch with production shutdown, etc.) for tank level control. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

LOD ID: **SMITH T7N-R64W-S18 L01**

Consent Decree Tank System Number: **1879**

**Audit Notes**

**Oil Dump Valve Size - Unknown**

Jobsheet (Final Packet, pg 19) indicates a new separator was installed onsite and ITEM A1 of the STEM Walkdown Checklist (Final Packet, pg 26) is checked "yes" indicating the oil dump trim is consistent with the Engineering Evaluation, and is therefore 3/8". There is no indication of the oil dump valve size installed in the separator onsite.

A 1" oil dump valve is used in the Engineering Evaluation, no documentation is provided to confirm this valve was/is installed on the LP separator. For the given trim size, 3/8", a 2" valve could be installed and therefore the Modeling Guideline cannot be confirmed as being strictly applied. Assuming a 2" valve size on the separator, the modeled results do not show an exceedance of the vapor control system capacity.

**Single Tank Battery**

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

**Audit Notes**

-The walkdown checklist was not marked complete. Modifications were confirmed using other documentation.

-The construction job sheet (SMITS HAREN T4N-R66W-S16 L01\_FINAL PACKET page 23) states that the PSHH was set to 50 psig. The QC Stem Checkout (SMITS HAREN T4N-R66W-S16 L01\_FINAL PACKET page 22) states that the PSHH was set to 60 psig. The QC Stem Checkout was completed on 6/8/2016 after the construction ended 5/26/2016. The PSHH set point from the QC Stem Checkout was used in these calculations because it was confirmed to be after the construction ended and results in a higher PPIVFR than the confirmed set point in the construction job sheet. 60 psig also matches the value used in the signed evaluation.

Consent Decree Tank System Number: **1938**

**Audit Notes**

The walkdown checklist (SOONER ST T5N-R64W-S36 L01\_WALKDOWN) was not marked as being complete. Completion was verified through other documentation in the final packet (SOONER ST T5N-R64W-S36 L01\_FINAL PACKET).

The STEM model (SOONER ST T5N-R64W-S36 L01\_STEM Engineering Evaluation\_rev1) was run with 2 oil tanks. The signed evaluation (SOONER ST T5N-R64W-S36 L01\_SIGNED EVAL, p 2) also only has 2 tanks on site. However, the field datasheet (SOONER ST T5N-R64W-S36 L01\_FINAL PACKET, p 12) says there are 3 tanks on site. STEM work request (SOONER ST T5N-R64W-S36 L01\_FINAL PACKET, p 12) states "Note: Aerial shows 3 tanks, but Production is planning to pull one to use on a legacy vertical battery." Walkdown checklist indicates there are only 2 tanks on site.

**Audit Notes**

The walkdown checklist is not marked complete

The stem work request (PG 3 of the Final Packet) states the existing 2" VOC line on the top of the tank was to be replaced with a 3" VOC line down to the KO pot however nowhere in the Job Sheets (PGs 21-23 of the Final Packet) does it confirm this task was completed

**NOBLE REQUEST:**

Field verification for this facility was completed on or around 1/19/2016, field verification confirmed that the 3" VOC line from the tank to the KO pot was installed.

Consent Decree Tank System Number: **2293**

**Audit Notes**

**STEM Walkdown Checklist**

ITEM C13 on the STEM Walkdown Checklist (Final Packet, pg 9) is checked "yes" indicating the LP separator onsite can produce into all tanks. The Jobsheet (Final Packet, pg 23) indicates an oil tank was bottomed out and is now being used as a vapor surge vessel. ITEM C13 is incorrectly checked "yes" as the LP separator can not produce into all tanks onsite.

**Oil Dump Valve Size - Unknown**

Job Sheet (Final Packet, pg 23) indicates a new LP separator which dumps to the tanks was installed onsite with an unknown oil dump valve size and trim size. ITEM A1 of the STEM Walkdown Checklist is checked "yes" indicating the oil dump trim size onsite is consistent with the trim size used in the Engineering Evaluation and is therefore 1/2".

A 1" oil dump valve is used in the Engineering Evaluation, no documentation is provided to confirm this valve was/is installed on the LP separator. For the given trim size, 1/2", a 2" valve could be installed and therefore the Modeling Guideline cannot be confirmed as being strictly applied. Assuming a 2" valve size on the separator, the modeled results do not show an exceedance of the vapor control system capacity.

**Audit Notes**

The work request (final packet, pg. 5) requests that two tanks be converted to headspace tanks. No documentation was provided to confirm this was completed. Noble provided verbal confirmation that two tanks were converted to headspace tanks on 8/25/2020.

The work request (final packet, pg. 5) requests that the below ground line be converted to a 4 inch above ground line. No documentation was provided to confirm this was completed but an above ground line is visible in the IR Camera videos.

The work request (final packet, pg. 5) requests that the unused Tornado burner be removed. No documentation was provided to confirm this was completed.

Consent Decree Tank System Number: **494 / 1923**

**Audit Notes**

The work request (final packet, pg. 5) requests that two tanks be converted to headspace tanks. No documentation was provided to confirm this was completed. It is unknown if the engineering design standard was strictly followed in this case.

The work request (final packet, pg. 5) requests that the below ground line be converted to a 4 inch above ground line. No documentation was provided to confirm this was completed but an above ground line is visible in the IR Camera videos.

The work request (final packet, pg. 5) requests that the unused Tornado burner be removed. No documentation was provided to confirm this was completed.

Consent Decree Tank System Number: **530**

**Audit Notes**

The stem work request (PG 3 of Final Packet pdf) states to disconnect tank #3 from the fill header, but leave connected to the VOC header to be used for headspace however nowhere in the job sheets (PGs 21-26 of Final Packet pdf) does it state this task was completed.

Noble provided a response to the above discrepancy on 11/14/2018 that states "Field verification for this facility was completed on or around 2/6/2017, field verification confirmed that one tank was converted to a headspace tank."

**LOD ID:** SPIKE GUTTERSEN ST T3N-R64W-S14 L01

**Consent Decree Tank System Number:** 560

**Audit Notes**

The stem work request (PG 4 of the Final Packet) states the existing 2" VOC line on the top of the tank was to be replaced with a 3" VOC line down to the KO pot however nowhere in the Job Sheets (PGs 26-30 of the Final Packet) does it confirm this task was completed  
Noble provided a response to the above discrepancy on 11/14/2018 that states "Field verification for this facility was completed on or around 1/30/2018, field verification confirmed that the 3" VOC line from the tank to the KO was installed."

Consent Decree Tank System Number: **1218**

**Audit Notes**

The stem work request (PG 3 of the Final Packet) states the existing 2" VOC line on the top of the tank was to be replaced with a 3" VOC line down to the KO pot however nowhere in the Job Sheets (PGs 22-26 of the Final Packet) does it confirm this task was completed

Noble provided a response to the above discrepancy on 11/14/2018 that states "Field verification for this facility was completed on or around 3/1/2017, field verification confirmed that the 3" VOC line from the tank to the KO was installed."

**Audit Notes**

1. The Work Request indicated the oil dump valves on Separators 2 were to be modified to Kimray 1400 with 1/2 inch trims. The trim size was confirmed by item A1 of the Walkdown Checklist. Could not verify the oil dump valve size (1") on separator with the documentation provided. Conservatively assumed the valve to be 2", the largest available size for 1/2" trim. It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.
2. The Signed Evaluation indicates one tank was to be left empty and used for headspace. The data request received on 11/14/2018 states that this was verified in the field on or around 8/15/2017.

Consent Decree Tank System Number: **33**

**Audit Notes**

The work request specifies installation of valves with 2" trims. The signed evaluation was completed with a 2" valve with a 1" trim. The Construction Jobsheet (Page 33 of the Final Packet) indicates a 1" 1400 valve with 1" trim was installed. A 1" 1400 valve with a 1" trim has a smaller valve coefficient (19.9 gpm/psi) and thus a lower oil flow rate than a 2" valve with a 1" trim (21.25 gpm/psi). The modeling guideline for this site was considered to be applied correctly for this tank system.

### Audit Notes

The stem work request form (PG 3 of Final Packet pdf) states for the pneumatic pshh to set the hp hi/lo no higher than 140 psig however nowhere in the job sheets (PGs 21-25) does it confirm this task was completed.

Noble provided a response to the above discrepancy on 11/14/2018 that states "The 'STEM Work Request Form' (Final Packet - page 4), 'STEM Design Confirmation Form' (Final Packet - page 9), the signed 'Vapor Control System Engineering Evaluation' (Signed Eval - page 1), the signed 'Vapor Control System Engineering Evaluation' (Final Signed STEM Plan - page 16), and 'One Pager' (laminated and posted on location) provide consistent documentation that the maximum separator operating pressure was set to no higher than 140 psig as requested. Signature on the Final Packet ensures work was executed per the 'STEM Work Request Form.' "

Consent Decree Tank System Number: **2343/1954**

**Audit Notes**

The walkdown checklist (STORIS E24 & MACKINAW A19 ECONODE T6N-R65W-S24 L01& WAKE T6N-R65W-S24 L01\_WALKDOWN) was not marked as being complete. Completion was verified through other documentation in the final packet (STORIS E24 & MACKINAW A19 ECONODE T6N-R65W-S24 L01& WAKE T6N-R65W-S24 L01\_FINAL PACKET).

The field data sheet (STORIS E24 & MACKINAW A19 ECONODE T6N-R65W-S24 L01& WAKE T6N-R65W-S24 L01\_FINAL PACKET, p 8-11) lists "no tab" for the oil valve and trim size for LP separators #2 and 3. The Data Request Response from 12/10/2018 confirmed these separators both have 2" valves with 1" trims.

There is not a valve size listed for water valve sizes for HP and LP separators #2, 3, and 4. The largest valve size (2") for a 1" trim was used to be conservative. Seat sizes for oil valves on LP separators #5, 7, 10, 11, 12, and 13 are unknown. Seat sizes for water valves on HP separators #5, 6, 7, 12, 13, 14, and 15 are unknown. The largest seat size (1") for a Kimray 2200 SMA valve was used in these calculations to be conservative.

The data request response from 12/10/2018 confirmed that the Wake E-24-77HN was moved into the HP separator with the Storis E24-75-1HN, as requested in the work request (WAKE T6N-R65W-S24 L01\_FINAL PACKET, p 3)

According to the Field datasheet (STORIS E24 & MACKINAW A19 ECONODE T6N-R65W-S24 L01& WAKE T6N-R65W-S24 L01\_FINAL PACKET, p 3 & 12) , the NPS from header to burners lists a 4" line to KO #2, a 6" line to KO #1, and a 3" line to the VRU. The model (STORIS E24 & MACKINAW A19 ECONODE T6N-R65W-S24 L01\_STEM Engineering Evaluation\_rev1) was run with one 8" line. This is conservative because an 8" line has a smaller effective diameter and thus more pressure drop than a 4" and 6" line combined.

The field data sheet (STORIS E24 & MACKINAW A19 ECONODE T6N-R65W-S24 L01& WAKE T6N-R65W-S24 L01\_FINAL PACKET, p 8-11 ) indicates there are 15 high/low separator trains on site. The model was run using oil dumps from 4 separators and water dumps from 8 separators. Based on the Tank System Document Review, the Modeling Guidance has not been correctly applied.

The tank system contains 2 banks each with 11 oil and 2 water tanks. Breathing emissions from the non-producing tank bank was not accounted for in the Signed Evaluation.

This site was selected for an additional IR Camera inspection because parts of the original footage is too dark to visually inspect for leaks.

**Audit Notes**

Surge Vessels: No confirmation on Job Sheet that tanks 3 & 5 disconnected for head space as requested on pp 3-4. Response to Data Request states: "Field verification for this facility was completed on or around 4/21/2016, field verification confirmed that two tanks were converted to headspace tanks." Results in adequate VCS with a 60% Max capacity.

Dump valve size: The Work Request form specifies that all the 212 dump valves on the HLP be replaced with a 1" 1400 with 1/2" trim. For the LP separator the Work Request form asks for confirmation that the oil dump valves are 1/2" trim. The Signed Evaluation considers two 2" & 1/2" oil dump valves. Based on the supplied field data, one of the dump valves should have been a 1" & 1/2" valve. For the analysis, a 2" dump valve with 1/2" trim would be conservative, so no further information is needed to verify the valve and trim size.

LOD ID: **SUSAN WESTERN T5N-R67W-S35 L01**

Consent Decree Tank System Number: **2228**

**Audit Notes**

-The walkdown checklist was not marked complete.

-The construction job sheet (SUSAN WESTERN T5N-R67W-S35 L01\_FINAL PACKET page 21) states that the PSHH was set to 60 psig. The QC Stem Checkout (SUSAN WESTERN T5N-R67W-S35 L01\_FINAL PACKET page 26) states that the PSHH was set to 70 psig. The QC Stem Checkout was completed on 4/11/2016 after the construction ended 4/5/2016. The PSHH set point from the QC Stem Checkout was used in these calculations because it was confirmed after the construction ended and results in a higher PPIVFR than the confirmed set point in the construction job sheet. The signed eval was completed at 70 psig.

-The size oil dump valve on the new HLP separator could not be confirmed. The signed evaluation was completed with a 1" valve. The largest valve size, 2" with the confirmed 3/8" trim size was used for these calculations. It is unknown if the modeling guideline was strictly followed with an unconfirmed valve size.

This site was selected for IR Camera Inspection based upon not knowing if modeling guidance was strictly followed.

LOD ID: **SWANSON OIL T6N-R66W-S28 L01**

Consent Decree Tank System Number: **7**

**Audit Notes**

The walkdown checklist (SWANSON OIL T6N-R66W-S28 L01\_WALKDOWN) was not marked as being complete. Completion was verified through other documentation in the final packet (SWANSON OIL T6N-R66W-S28 L01\_FINAL PACKET).

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

**Audit Notes**

Headspace Tanks: The Work Request form specifies one of the 300 bbl oil tanks to be used as a headspace tank. There is no information in the field documents that confirms one of the 300 bbl oil tanks was disconnected from the fill header and left connected to the VOC header to be used as a headspace tank. Noble confirmed verbally on 8/25/2020 that one tank was converted to a headspace tank.

LOD ID: **TANIA GUTTERSEN T3N-R64W-S2 L01**

Consent Decree Tank System Number: **504**

**Audit Notes**

The stem work request (PG 3 of Final Packet pdf) states to disconnect tank 5 from the fill header but leave connected to the VOC header to be used for headspace however nowhere in the job sheets (PGs 21-25 of Final Packet pdf) does it state this task was completed.

Noble provided a response to the above discrepancy on 11/14/2018 that states "Field verification for this facility was completed on or around 6/6/2016, field verification confirmed that one tank was converted to a headspace tank."

LOD ID: **THISTLE DOWN ST T5N-R65W-S25 L01**

Consent Decree Tank System Number: **2027**

### Audit Notes

The signed evaluation states that there is no tank banking, however the final packet states that the tanks are banked (FINAL PACKET p. 30).

Noble provided a response to the above discrepancy on 11/14/2018 that states "An engineering review of this facility was completed on or around 9/17/2018, this review confirmed that the tanks are not banked."

**Engineering Evaluation Verification Audit**  
Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **THISTLE DOWN ST T5N-R65W-S36 L01**

Consent Decree Tank System Number: **273**

**Audit Notes**

The walkdown checklist (THISTLE DOWN ST T5N-R65W-S36 L01 & ST FARM T5N-R65W-S36 L01\_WALKDOWN) was not marked as being complete. Completion of the STEM work request was verified through other documentation in the final packet (THISTLE DOWN ST T5N-R65W-S36 L01 & ST FARM T5N-R65W-S36 L01\_FINAL PACKET).

The signed eval (THISTLE DOWN ST T5N-R65W-S36 L01 & ST FARM T5N-R65W-S36 L01\_SIGNED EVAL) states there are 3 water tanks connected to the VCS system. The field datasheet (THISTLE DOWN ST T5N-R65W-S36 L01 & ST FARM T5N-R65W-S36 L01\_FINAL PACKET, p 6) does not indicate the three (3) 300 bbl water tanks are connected to the VCS system. The field datasheet drawing (THISTLE DOWN ST T5N-R65W-S36 L01 & ST FARM T5N-R65W-S36 L01\_FINAL PACKET, p 4) shows the water tanks are connected to the main VCS line. The water tanks were left in the model to be conservative.

The field datasheet (THISTLE DOWN ST T5N-R65W-S36 L01 & ST FARM T5N-R65W-S36 L01\_FINAL PACKET, p 7) state that the oil outlet for the separator for State Farm 36-6, 11 is routed to tank 9 which vents to atmosphere and is not part of the VCS. The work request asks to double check if the State Farm 36-06,11 is comingled with the Thistle Down State PC F36-67HN and that the Comingled was "done by STEM pre-May 1st." There is not data provided confirming this double check was completed. The signed eval (THISTLE DOWN ST T5N-R65W-S36 L01 & ST FARM T5N-R65W-S36 L01\_SIGNED EVAL) has the State Farm 36-6,11 oil comingled in an LP separator with the Thistle Down State PC F36-67HN and the water going directly to tanks from the HP separator. The modeling guideline was still strictly applied because either the separator is comingled as indicated or it dumps to a tank that is not part of the VCS.

**Audit Notes**

Emissions were observed on the tank closest to the equipment on site during the dump video (SN 17860). Emissions appear to be coming from a PRV on top of tank, therefore this site has been selected for IR camera inspection.

LOD ID: **THOMPSON T4N-R64W-S28 L03**

Consent Decree Tank System Number: **508**

**Audit Notes**

**1. Field Datasheets are not dated**

The Field Datasheets (Final Packet pg 11-16) are not dated. Assumed the date is the same as Facility Scouting date (3/22/16).

**2. Number of vapor surge vessels onsite**

The STEM Work Request (Final Packet pg 3), requests three oil tanks be bottomed out and used as surge vessels onsite. The Job Sheet (Final Packet pg 21) indicates that oil lines on the tanks were modified. Check C8 & C13 of the Walkdown Checklist (Final Packet pg 29) are checked "N/A" and the Field Datasheet (Final packet pg 14) indicate each HP/LP separator combination produce to separate oil tanks. Given the above information it is determined that three vapor surge vessels are currently onsite.

**Update 6/13/2018 - Noble confirms via data request the three tanks were converted into headspace tanks.**

**3. Tank combustor information not consistent**

The Field Data Sheet (Final Packet pg 15) shows two tank combustors previously existing onsite. The Installed Equipment Sheet (Final Packet pg 22) indicates two new LEED 48" burners were installed onsite. However, the serial numbers included on the installed equipment sheet match those of the existing combustors on the field data sheet. Therefore the existing combustors are still being used onsite and new combustors were never installed

**4. Separator information not consistent**

In the provided documentation there are discrepancies in how the configuration of the existing separators was modified. The STEM Work Request Form (Final Packet pg 3) lists three separators for removal (#1, #4, and #5 on the field data sheet, Final Packet pg 14). The Job Sheet (Final Packet pg 23) indicates separators #1, #3, and #8 were removed. The automation email (Final Packet pg 26) is in agreement with the STEM Work Request Form, indicating that the job sheet is erroneous. The STEM Walkdown Checklist (Final Packet pg 29), specifically checks C1, C3-C8 and C13, provide enough information to confirm the proper separator configuration is currently onsite.

LOD ID: **THOMSON SLW RANCH T5N-R64W-S12 L01**

Consent Decree Tank System Number: **290**

**Audit Notes**

**Oil Dump Valve Size - Unknown**

Field Datasheet (Final Packet, pg 13) shows the HLP separator onsite originally had a 2" oil dump valve with unknown trim size. The STEM Work Request Form (Final Packet, pg 3) requests the existing 2" oil dump valve be replaced with a 1" valve with 1/2" trim. The Engineering Evaluation shows a 1" oil dump valve onsite with 1/2" trim. ITEM A1 of the STEM Walkdown Checklist (Final Packet, pg 6) is checked "yes" indicating the oil dump trim size onsite is consistent with the trim size used in the Engineering Evaluation, and is therefore 1/2".

A 1" oil dump valve is used in the Engineering Evaluation, no documentation is provided to confirm this valve was/is installed on the separator onsite. For the given trim size, 1/2", a 2" valve could be installed and therefore the Modeling Guideline cannot be confirmed as being strictly applied. Assuming a 2" valve size on the separator, the modeled results do not show an exceedance of the vapor control system capacity.

LOD ID: **TIGGES T6N-R66W-S19 L01**

Consent Decree Tank System Number: **1780**

**Audit Notes**

**Possible IR Signature Observed**

Possible IR signature observed at ~1 min 50 secs into both the 1672 DUMP and 1673 POST IR videos. It appears the IR signature originates from the combustors behind the tanks and not the tank itself.

**Oil Tank Sizes**

Field datasheets (Final Packet, pg 11) indicate (1) 210 bbl oil tank and (1) 300 bbl oil tank onsite. Noble averaged these two tank sizes together and used (2) 255 bbl oil tanks onsite in the Engineering Evaluation. These tanks have not been removed and exist onsite currently.

**Separator Max Operating Pressure**

ITEM B3 of the STEM Checklist is checked "yes", indicating that the low pressure separator is set to shut in at 70 psig according to the Signed Eval.

**Oil Dump Valve Size - Unknown**

The Engineering Evaluation shows a 1" oil dump valve onsite with 1/2" trim. The Job Sheet (Final Packet, pg 21) indicates the HLP separator onsite is new and no documentation is provided indicating the oil dump valve and/or trim size. ITEM A1 of the STEM Walkdown Checklist (Final Packet, pg 7) is checked "yes", indicating the oil dump trim size onsite is 1/2".

A 1" oil dump valve is used in the Engineering Evaluation, no documentation is provided to confirm this valve was/is installed on the separator onsite. For the given trim size, 1/2", a 2" valve could be installed and therefore the Modeling Guideline cannot be confirmed as being followed. Assuming a 2" valve size on the separator, the modeled results do not show an exceedance of the vapor control system capacity.

**Audit Notes**

The work request (FINAL PACKET p. 4) states that the VOC line from the tank to the KO needs to be changed from 2" to 3". There is no verification that this work was completed (FINAL PACKET p. 8-31). Noble provided a response to the above discrepancy on 11/14/2018 that states "Field verification for this facility was completed on or around 8/3/2016, field verification confirmed that the 3" VOC line from the tank to the KO was installed."

Consent Decree Tank System Number: **1250**

**Audit Notes**

The single oil tank fill level was certified to 90% with equalizer height as the control method. A single tank is unable to limit fill level via equalizer height and must utilize other means (level switch with production shutdown, etc.) for tank level control. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

**Audit Notes**

Emissions were observed on tank 1 (SN 14014) during the dump video. Emissions appear to be coming from the their hatch on top of tank, therefore this site has been selected for IR camera inspection.

LOD ID: **UHRICH T6N-R64W-S29 L01**

Consent Decree Tank System Number: **2154**

**Audit Notes**

**Field Datasheets - Adjacent Location Info**

Field Datasheets (Final Packet, pg 14-18) contain site info from an adjacent location. The adjacent location information was not used in this audit as it does not pertain to this site.

**Oil Dump Valve Size - Unknown**

Field Datasheet (Final Packet, pg 14) shows the current LP separator onsite (Separator 2, Well 19-29) originally had a 1" oil dump valve with 1/2" trim size. The Engineering Evaluation shows the LP separator onsite to currently have a 2" oil dump valve with 3/8" trim.

ITEM A1 of the STEM Walkdown Checklist is checked "yes" indicating the oil dump trim size onsite is consistent with the trim size used in the Engineering Evaluation, and is therefore 3/8".

A 2" oil dump valve is used in the Engineering Evaluation, no documentation is provided to confirm this valve was/is installed on the LP separator. For the given trim size, 3/8", a 2" valve is the largest valve available to be used, therefore it is the most conservative available valve size option and the Modeling Guideline can be confirmed as being strictly applied.

**Single Tank Battery**

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

**Audit Notes**

The stem work request (PG 3 of the Final Packet) states the existing 2" VOC line on the top of the tank was to be replaced with a 3" VOC line down to the KO pot however nowhere in the Job Sheets (PGs 23-27 of the Final Packet) does it confirm this task was completed

Noble provided a response to the above discrepancy on 11/14/2018 that states "Field verification for this facility was completed on or around 7/7/2016, field verification confirmed that the 3" VOC line from the tank to the KO was installed."

The signed eval and stem engineering evaluation modeled the site as having 1 headspace tank however nowhere in the final packet does it verify there is a tank used for headspace at the site.

Noble provided a response to the above discrepancy on 11/14/2018 that states "An engineering review of this facility was completed on or around 9/17/2018, this review confirmed there was not a request for a tank to be converted to a headspace tank."

Consent Decree Tank System Number: **310/1016**

**Audit Notes**

The walkdown checklist is not marked complete

- The field datasheets (PG 15 of FINAL PACKET pdf) shows the size of the vapor line was 2" the stem work request form (PG 5 of FINAL PACKET pdf) does not specify a change to diameter. The stem design confirmation form (PG 8 of FINAL PACKET pdf), the signed eval, and the stem engineering evaluation lists the size of the pipe is listed at 3". In this case the engineering design standard has not been strictly followed.

## Engineering Evaluation Verification Audit

Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **UPRC FIVE RIVERS T4N-R66W-S16 L01**

Consent Decree Tank System Number: **180**

### Audit Notes

The walkdown checklist is not marked complete

The work request (pg 3 FINAL PACKET) states that the VOC line header for tanks 72708 and 72711 needs to be increased from 2" to 3" and ran to the same KO as tanks 360646 and 360645. There is no verification that this work was completed (pg 20-25 FINAL PACKET).

#### NOBLE REQUEST:

Field verification for this facility was completed on or around 12/2/2015, field verification confirmed that the 3" VOC line from the tanks to the KO pot was installed.

**Audit Notes**

The walkdown checklist is not marked complete

CB - There is no confirmation in the Job Sheets that the existing 212 HLP LP oil dump was replaced with a 1" 1400 with a 1/2" trim (as requested on the Work Request.

Assume Item A1 of the Retrofit Walkdown Checklist is confirmation from the client that the oil dump valve was replaced.

LOD ID: **UPRC T4N-R66W-S33 L01**

Consent Decree Tank System Number: **857**

**Audit Notes**

**1. Field Datasheets**

The Field Datasheets (Final Packet, pg 11-17) are not dated. Assumed the date is the same as Facility Scouting date (6/9/2016).

**2. Single Oil Tank Liquid Level**

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

**Audit Notes**

**Single Tank Battery**

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

**Oil Dump Valve Size**

A new LP separator was brought on-site to develop a HP-LP train. Could not verify the oil dump valve size (2" or 1") of the new LP separator. The trim size is confirmed on the Job Sheet, page 21 of Final Packet. Conservatively assumed the valve to be 2", the largest available size for 1/2" trim, the Modeling Guideline cannot be considered strictly applied.

**Audit Notes**

The Work Request indicated the oil dump valve on the HLP Separator was to be modified to Kimray 1400 with 1/2 inch trims. Could not verify the oil dump valve size (2" or 1") on the separator with the documentation provided. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim.

It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

LOD ID: **UPV T4N-R64W-S25 L01**

Consent Decree Tank System Number: **982**

**Audit Notes**

The single oil tank fill level was certified to 90% with equalizer height as the control method. A single tank is unable to limit fill level via equalizer height and must utilize other means (level switch with production shutdown, etc.) for tank level control. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

LOD ID: **UPV T6N-R63W-S33 L02**

Consent Decree Tank System Number: **1022**

**Audit Notes**

**Oil Dump Valve Size - Unknown**

Jobsheet (Final Packet, pg 21) indicates a new LP separator was installed onsite and ITEM A1 of the STEM Walkdown Checklist (Final Packet, pg 6) is checked "yes" indicating the oil dump trim is consistent with the Engineering Evaluation, and is therefore 3/8". There is no indication of the oil dump valve size installed in the separator onsite.

A 1" oil dump valve is used in the Engineering Evaluation, no documentation is provided to confirm this valve was/is installed on the LP separator. For the given trim size, 3/8", a 2" valve could be installed and therefore the Modeling Guideline cannot be confirmed as being strictly applied. Assuming a 2" valve size on the separator, the modeled results do not show an exceedance of the vapor control system capacity.

**Single Tank Battery**

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

**Audit Notes**

There is conflicting data regarding the manufacturer of tank burner located on site. However, of the two burners in question, the tornado was used in the model as its calculated burner capacity is more conservative than that of the lead burner.

**Audit Notes**

The walkdown checklist (WADE T8N-R59W-S29 L01\_WALKDOWN) was not marked as being complete. Completion was verified through other documentation in the final packet (WADE T8N-R59W-S29 L01\_FINAL PACKET).

The separator pneumatic PSHH is set by the operator not automation and therefore no QA/QC checklist was provided to confirm the maximum pressure of the separator. The STEM One-Pager states that the separator cannot operate above 155 psig and was posted on location via item A14 of the Walkdown Checklist. This serves as confirmation of administrative controls in place to keep the separator below the maximum pressure used in the Engineering Evaluation.

Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: WAHLERT AC33 ECONODE T7N-R63W-S3 L01

Consent Decree Tank System Number: 1992

**Audit Notes**

The Engineering Evaluation is completed with "doubled-up" entries for the LP oil, HP water, and LP water dump rates. The peak dump rates correspond to a single separator dump rate and not rate which is "doubled-up" as indicated on the Certification Report. Because the peak dump rates are underestimated, the Modeling Guideline has not been strictly applied.

The Engineering Evaluation did not include breathing losses from the non-production accepting tank bank. The facility configuration has two banks - one bank with five (5) oil tanks and two (2) water tanks, and another bank with five (5) oil tanks and two (2) water tanks. By excluding the breathing losses from the non-production accepting bank which continues to store oil, the correct application of the Modeling Guidelines cannot be verified.

A Rework Order request was issued to "bottom out" the NW-most oil tank; remove the oil fill line from the tank while keeping the tank connected to the VCS in order to be utilized as head space only. There is no Job Sheet associated with this rework request. On 12/21/2018 Noble confirmed the existence of a vapor headspace tank on location. This vapor headspace tank shares its vapor capacity with both banks of tanks on this location, confirming the tank banking configuration of one bank of 5 oil tanks, 2 water tanks, and a second bank of 4 oil tanks, 2 water tanks, and 1 shared vapor headspace tank.

Final Packet (WALCKER T7N-R63W-S7 L01\_FINAL PACKET) is missing pages: front signature page, Field Datasheet Oil Tank, Separator, VRT pages.

NEI's Data Request Response:

Facility walkdown provided in this 3rd Information Request Response titled 097\_WALCKER T7N-R63W-S7 L01 Facility Walkdown.

Once the full field datasheet had been provided, it was determined that both the modeling guideline and the engineering design standard were adequately followed.

LOD ID: **WALCKER T7N-R63W-S17 L02**

Consent Decree Tank System Number: **1984**

**Audit Notes**

The Walkdown Checklist (WALCKER T7N-R63W-S17 L02\_WALKDOWN.pdf, pg. 4) did not indicate if all items on the Work Request form had been completed. Completion of the Work Request was verified through other documentation in the Final Packet.

The Signed Eval (WALCKER T7N-R63W-S17 L02\_SIGNED EVAL.pdf, pg. 2) indicates a tank max fill of 72 %. Assuming that the tanks are all at 90 %, with one tank bottomed out for headspace as indicated, the max fill is incorrect  $[(5/6) * 90\% = 75\%]$ .

Per the Work Request (WALCKER T7N-R63W-S17 L02\_FINAL PACKET.pdf, pg. 3) the HP separator pressure to be modified to 180 psig max. Supplied data from the 11/30/2017 data request supports this.

Per the Field Datasheet (WALCKER T7N-R63W-S17 L02\_FINAL PACKET.pdf, pg. 13) the 300-bbl water tank connected to the VCS line is only supplied by the LP separator. However, the Signed Eval (WALCKER T7N-R63W-S17 L02\_SIGNED EVAL.pdf, pg 2) only indicates the HP and LP separator dump sizes to the water tank. The valve size was assumed to be 2" to be conservative. A 2" valve was used in the model to be conservative. It is unknown if the modeling guideline was strictly applied.

LOD ID: **WALCKER T7N-R64W-S12 L02**

Consent Decree Tank System Number: **1900**

### Audit Notes

The stem work request form (PG 3 of Final Packet pdf) states for the pneumatic pshh to set the hp hi/lo no higher than 175 psig however nowhere in the job sheets (PGs 18-20) does it confirm this task was completed.

Noble provided a response to the above discrepancy on 11/14/2018 that states "The 'STEM Work Request Form' (Final Packet - page 3), 'STEM Design Confirmation Form' (Final Packet - page 4), the signed 'Vapor Control System Engineering Evaluation' (Signed Eval - page 1), the signed 'Vapor Control System Engineering Evaluation' (Final Signed STEM Plan - page 16), and 'One Pager' (laminated and posted on location) provide consistent documentation that the maximum separator operating pressure was set to no higher than 175 psig as requested. Signature on the Final Packet ensures work was executed per the 'STEM Work Request Form.' "

LOD ID: **WARDLAW T6N-R64W-S28 L01**

Consent Decree Tank System Number: **2093**

**Audit Notes**

The single oil tank fill level was certified to 90% with equalizer height as the control method. A single tank is unable to limit fill level via equalizer height and must utilize other means (level switch with production shutdown, etc.) for tank level control. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

**Audit Notes**

The walkdown checklist (WARDLAW T6N-R64W-S35 L01 & SHARKEY T6N-R64W-S35 L01\_WALKDOWN) was not marked as being complete. Completion was verified through other documentation in the final packet (WARDLAW T6N-R64W-S35 L01 & SHARKEY T6N-R64W-S35 L01\_FINAL PACKET).

The STEM work request document (WARDLAW T6N-R64W-S35 L01 & SHARKEY T6N-R64W-S35 L01\_FINAL PACKET, p 5) requests that the existing 270# HP separator be replaced with a new or B-Grade HLP separator. The job sheet (WARDLAW T6N-R64W-S35 L01 & SHARKEY T6N-R64W-S35 L01\_FINAL PACKET, p 32) confirms the 270# separator was swapped for a HLP separator. A1 from the walkdown checklist (WARDLAW T6N-R64W-S35 L01 & SHARKEY T6N-R64W-S35 L01\_WALKDOWN, p 1) confirms the trim size is 1/2". There is no confirmation of the new valve size, therefore the model was run with a 2" valve to be conservative. It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

This site was selected for an additional IR Camera inspection because the original videos were shot on a cloudy day, making it difficult to visually inspect for leaks.

LOD ID: **WASHBURN T8N-R61W-S22 L01**

Consent Decree Tank System Number: **1982**

**Audit Notes**

The work request (FINAL PACKET p. 3) states that the PSHH needs to be set to 185 psig. There is no verification that this work was completed (FINAL PACKET p.4-29)

Noble provided a response to the above discrepancy on 11/14/2018 that states "The 'STEM Work Request Form' (Final Packet - page 3), 'STEM Design Confirmation Form' (Final Packet - page 7), the signed 'Vapor Control System Engineering Evaluation' (Signed Eval - page 1), the signed 'Vapor Control System Engineering Evaluation' (Final Signed STEM Plan - page 16), and 'One Pager' (laminated and posted on location) provide consistent documentation that the maximum separator operating pressure was set to no higher than 185 psig as requested. Signature on the Final Packet ensures work was executed per the 'STEM Work Request Form.' "

**LOD ID:** WATKINS BARNETT T4N-R64W-S12 L01

**Consent Decree Tank System Number:** 446

**Audit Notes**

The walkdown checklist (WATKINS BARNETT T4N-R64W-S12 L01\_WALKDOWN) was not marked as being complete. Completion was verified through other documentation in the final packet (WATKINS BARNETT T4N-R64W-S12 L01\_FINAL PACKET)

The Signed Evaluation (WATKINS BARNETT T4N-R64W-S12 L01\_SIGNED EVAL) includes 3 (300 bbl) tanks on the site, with 1 of them to be used just for headspace. However, the model (WATKINS BARNETT T4N-R64W-S12 L01\_STEM Engineering Evaluation\_rev1) was run using only 2 tanks and a 60% fill capacity. This error results in underestimation of breathing losses and headspace surge capacity. The modeling guideline in this case was not strictly followed.

LOD ID: **WATKINS SATER T4N-R63W-S18 L01**

Consent Decree Tank System Number: **462**

**Audit Notes**

THE WALKDOWN CHECKLIST WAS NOT MARKED COMPLETE.

CB - Vapor headspace tank: There is no confirmation in the field data that one tank was bottomed out and disconnected from the fill header to be used as a headspace tank.

CB - Separator Pressure: There is no confirmation in the field data that the HP separator PSHH was set to 140 psig. This pressure was specified in the Work Request Form and used in the Signed Evaluation.

Noble Response:

Field verification for this facility was completed on or around 9/15/2016, field verification confirmed that one tank was converted to a headspace tank.

Noble has provided the following response regarding the pneumatic PSHH setting on the HP separator:

"The separator pneumatic PSHH is set by the operator, not automation, and therefore no QA/QC checklist was provided to confirm the maximum pressure of the separator. The STEM One-Pager states that the separator cannot operate above 140 psig and was posted on location via Walkdown Checklist Item A14. This serves as confirmation of administrative controls in place to keep the separator below the maximum pressure used in the Engineering Evaluation."

**Audit Notes**

The stem work request form (PG 3 of Final Packet pdf) states for the pneumatic pshh to set the hp hi/lo no higher than 115 psig however nowhere in the job sheets (PGs 18-22) does it confirm this task was completed.

Noble provided a response to the above discrepancy on 11/14/2018 that states "The 'STEM Work Request Form' (Final Packet - page 3), 'STEM Design Confirmation Form' (Final Packet - page 5), the signed 'Vapor Control System Engineering Evaluation' (Signed Eval - page 1), the signed 'Vapor Control System Engineering Evaluation' (Final Signed STEM Plan - page 16), and 'One Pager' (laminated and posted on location) provide consistent documentation that the maximum separator operating pressure was set to no higher than 115 psig as requested. Signature on the Final Packet ensures work was executed per the 'STEM Work Request Form.' "

The stem work request (PG 3 of the Final Packet) states the existing 2" VOC line on the top of the tank was to be replaced with a 3" VOC line down to the KO pot however nowhere in the Job Sheets (PGs 18-22 of the Final Packet) does it confirm this task was completed

Noble provided a response to the above discrepancy on 11/14/2018 that states "Field verification for this facility was completed on or around 10/17/2016, field verification confirmed that the 3" VOC line from the tank to the KO was installed."

**Audit Notes**

A Work Order request was issued to "bottom out" one oil tank; remove the oil fill line from the tank while keeping the tank connected to the VCS in order to be utilized as head space only. The accompanying Job Sheet did not confirm the tank was "bottomed out" and the Walkdown Checklist was not checked as complete to "Confirm all the items on the work request form have been completed." Additionally, the provided STEM Retrofit Walkdown Checklist, Item C13, was checked "yes" indicating all tank fill lines are configured to enable LP separators to produce into all tanks.

Noble provided information on 12/10/2018 indicating a "Field verification for this facility was completed on or around 6/27/2016, field verification confirmed that one tank was converted to a headspace tank." The Engineering Design Standard has been appropriately applied based on the provided field verification information.

Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **WATKINS SATER UPV T4N-R64W-S14 L01**

Consent Decree Tank System Number: **469**

**Audit Notes**

The single oil tank fill level was certified to 90% with equalizer height as the control method. A single tank is unable to limit fill level via equalizer height and must utilize other means (level switch with production shutdown, etc.) for tank level control. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

**Audit Notes**

The walkdown checklist is not marked complete

The STEM work request (PG 3 of the Final Packet) states the existing 2" VOC line on the top of the tank was to be replaced with a 3" VOC line down to the KO pot, however, nowhere in the Job Sheets (PGs 19-23 of the Final Packet) does it confirm this task was completed.

Noble provided a response to the above discrepancy on 11/14/2018 that states "Field verification for this facility was completed on or around 9/21/2016, field verification confirmed that the 3" VOC line from the tank to the KO pot was installed."

LOD ID: **WAUGH PC T7N-R64W-S8 L01**

Consent Decree Tank System Number: **1877**

**Audit Notes**

The walkdown checklist is not marked complete

CB - The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

SLR Evaluation shows the VCS capacity to be adequate.

LOD ID: **WEBSTER T5N-R64W-S6 L01**

Consent Decree Tank System Number: **1482**

**Audit Notes**

The walkdown checklist (WEBSTER T5N-R64W-S6 L01\_WALKDOWN) was not marked as being complete. Completion was verified through other documentation in the final packet (WEBSTER T5N-R64W-S6 L01\_FINAL PACKET).

The STEM work request (WEBSTER T5N-R64W-S6 L01\_FINAL PACKET, p 3) requested a new D-Grade LP separator to be installed , and to reduce the new LP dump valve to 1/2" trim. The new separator was confirmed to be installed on the Job Sheet (WEBSTER T5N-R64W-S6 L01\_FINAL PACKET, p 23) and the valve trim was confirmed to be 1/2" on item A1 of the walkdown checklist. There is no confirmation of the new valve size. A 2" valve, the largest valve with a 1/2" trim, was used to be conservative. It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

LOD ID: **WELCH T7N-R63W-S21 L01**

Consent Decree Tank System Number: **1584**

**Audit Notes**

**Oil Dump Valve Size - Unknown**

Jobsheet (Final Packet, pg 21) indicates a new LP separator was installed onsite and ITEM A1 of the STEM Walkdown Checklist (Final Packet, pg 27) is checked "yes" indicating the oil dump trim is consistent with the Engineering Evaluation, and is therefore 1/2". There is no indication of the oil dump valve size installed in the separator onsite.

A 1" oil dump valve is used in the Engineering Evaluation, no documentation is provided to confirm this valve was/is installed on the HP separator. For the given trim size, 1/2", a 2" valve could be installed and therefore the Modeling Guideline cannot be confirmed as being strictly applied. Assuming a 2" valve size on the separator, the modeled results do not show an exceedance of the vapor control system capacity.

**Single Tank Battery**

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

LOD ID: **WELD COUNTY T5N-R65W-S1 L01**

Consent Decree Tank System Number: **999**

**Audit Notes**

The walkdown checklist (WELD COUNTY T5N-R65W-S1 L01\_WALKDOWN) was not marked as being complete. Completion was verified through other supplied documentation in the final packet (WELD COUNTY T5N-R65W-S1 L01\_FINAL PACKET).

The STEM work request form (WELD COUNTY T5N-R65W-S1 L01\_FINAL PACKET, p 3) requests that the existing separator's 212 oil dump valve be replaced with a 1" 1400 with a 1/2" trim. The Job sheet (WELD COUNTY T5N-R65W-S1 L01\_FINAL PACKET, p 23) does not mention updating the valve or trim size. However, A1 of the walkdown checklist (WELD COUNTY T5N-R65W-S1 L01\_WALKDOWN) confirms the signed eval (WELD COUNTY T5N-R65W-S1 L01\_SIGNED EVAL) used the correct trim size. A 2" valve, the largest valve with a 1/2" trim, was used in the model to be conservative. It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

The STEM work request form (WELD COUNTY T5N-R65W-S1 L01\_FINAL PACKET, p 3) requests that the existing 2" line on top of the tanks be replaced with a 3" line. The data request response from 12/10/2018 confirmed the VOC has been replaced with a 3" line.

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **WELLS RANCH AA T6N-R63W-S26 L01**

Consent Decree Tank System Number: **1575**

### Audit Notes

CAB - There is no documentation that the separator PSHH was set to 140 psig as requested in the Stem Work Request Form ("Pneumatic PSHH: Set hi/lo controller to shut hi/low valve at 140 psig line pressure. According to the Field Data Sheets, the separator PRV is set to 275 psig.

Noble Response:

The 'STEM Work Request Form' (Final Packet - page 3), 'STEM Design Confirmation Form' (Final Packet - page 4), the signed 'Vapor Control System Engineering Evaluation' (Signed Eval - page 1), the signed 'Vapor Control System Engineering Evaluation' (Final Signed STEM Plan - page 16), and 'One Pager' (laminated and posted on location) provide consistent documentation that the maximum separator operating pressure was set to no higher than 140 psig as requested. Signature on the Final Packet ensures work was executed per the 'STEM Work Request Form.'

**Audit Notes**

**Separator Max Operating Pressure**

The STEM Work Request Form (Final Packet, pg 3) requests the separator onsite be set to operate at no higher than 210 psig. Check #1 on the Signed Walkdown Form (Final Packet, pg 24) is checked "complete", confirming all items on the Work Request Form have been completed. This confirms the separator onsite is set at no higher than 210 psig.

**Oil Dump Valve and Trim Size**

The STEM Work Request Form (Final Packet, pg 3) requests a 1" oil dump valve with 1/4" trim be installed in the separator onsite. Check #1 on the Signed Walkdown Form (Final Packet, pg 24) is checked "complete", confirming all items on the Work Request Form have been completed. Therefore it is confirmed the oil dump valve currently onsite is a 1" sized valve with 1/4" trim. ITEM A1 of the STEM Walkdown Checklist (Final Packet, pg 5) is checked "yes", indicating the oil dump trim is consistent with the Engineering Evaluation and therefore is 1/4".

Consent Decree Tank System Number: **1972**

**Audit Notes**

**Separator Operating Pressure - Request Additional Data**

The Engineering Evaluation indicates the max separator operating pressure onsite for all separators is 400 psig which is the pipeline ESD shut in pressure.

**Separator Oil/Water Valve Trim**

The Engineering Evaluation indicates all separators onsite have a 2" valve trim size for both the oil and water dump valves. The field datasheet (Final Packet, pg 10) indicates all the actual valve trims onsite are 2" or smaller depending on the separator. If a smaller than 2" valve trim is installed on a separator the PPIVFR is conservatively being overestimated and the modeling guideline is being met. No action required.

### Audit Notes

The stem work request form (PG 3 of Final Packet pdf) states for the pneumatic pshh to set the hp hi/lo no higher than 140 psig however nowhere in the job sheets (PGs 19-23) does it confirm this task was completed.

Noble provided a response to the above discrepancy on 11/14/2018 that states "The 'STEM Work Request Form' (Final Packet - page 3), 'STEM Design Confirmation Form' (Final Packet - page 4), the signed 'Vapor Control System Engineering Evaluation' (Signed Eval - page 1), the signed 'Vapor Control System Engineering Evaluation' (Final Signed STEM Plan - page 16), and 'One Pager' (laminated and posted on location) provide consistent documentation that the maximum separator operating pressure was set to no higher than 140 psig as requested. Signature on the Final Packet ensures work was executed per the 'STEM Work Request Form.' "

The stem work request (PG 3 of the Final Packet) states the existing 2" VOC line on the top of the tank was to be replaced with a 3" VOC line down to the KO pot however nowhere in the Job Sheets (PGs 19-23 of the Final Packet) does it confirm this task was completed

Noble provided a response to the above discrepancy on 11/14/2018 that states "Field verification for this facility was completed on or around 2/16/2016, field verification confirmed that the 3" VOC line from the tank to the KO was installed."

Consent Decree Tank System Number: **343**

**Audit Notes**

NEI did not include breathing losses from the non-production accepting tank bank in the Engineering Evaluation. The facility configuration has two banks - one bank with seven (7) oil tanks and one water tank, and another bank with eight (8) oil tanks and one water tank. By excluding the breathing losses from the non-production accepting bank which continued to store oil, the correct application of the Modeling Guidelines cannot be verified.

**Audit Notes**

**Tank Combustors**

Field Datasheet (Final Packet, pg 13) confirms a LEED HOC 48" (same as LEED 48" Gen 1 #7) existing onsite, this combustor has not been modified and exists onsite currently. Pg 21 of Final Packet shows an additional tank burner was installed onsite. The burner serial number and actuator serial number that are given are consistent with that of a Tornado 48" burner. This confirms a LEED and Tornado tank burner onsite.

**Audit Notes**

**Oil Dump Valve Size - Unknown**

Field Datasheet (Final Packet, pg 12) shows the separator onsite originally had a 2" oil dump valve with unknown trim size. The Engineering Evaluation shows a 1" oil dump valve with 1/2" trim currently onsite. The Job Sheet (Final Packet, pg 20) confirms the oil dump trim size was checked onsite and is consistent with the trim size in the STEM Work Request (Final Packet, pg 3), 1/2".

A 1" oil dump valve is used in the Engineering Evaluation, no documentation is provided to confirm this valve was/is installed on the separator. For the given trim size, 1/2", a 2" valve could be installed and therefore the Modeling Guideline cannot be confirmed as being strictly applied. Assuming a 2" valve size on the separator, the modeled results do not show an exceedance of the vapor control system capacity.

## Engineering Evaluation Verification Audit

Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **WELLS RANCH T5N-R62W-S7 L01**

Consent Decree Tank System Number: **1880**

### Audit Notes

The STEM Work Request indicated the 2" VOC line on the top of the oil storage tanks to the KO pot was to be replaced with a 3" line. There is no confirmation the Tanks to KO VCS piping was modified to 3".

Noble provided information on 11/14/2018 indicating a "Field verification for this facility was completed on or around 4/6/2016, field verification confirmed that the 3" VOC line from the tank to the KO was installed." The Engineering Design Standard was appropriately applied based on the provided field verification information.

The separator on location has pressure controlled by a pneumatic controller. The initial provided documentation did not confirm the controller shut-in pressure was set to 90 psig as requested in the STEM Work Request dated 3/3/2016.

The separator pneumatic PSHH is set by the operator, not automation personnel, and therefore no QA/QC checklist was provided to confirm the maximum pressure of the separator. The STEM One-Pager states the separator cannot operate above 90 psig and was posted on location via Walkdown Checklist Item A14. This serves as confirmation of administrative controls in place to keep the separator below the maximum pressure used in the Engineering Evaluation. It was determined the Modeling Guidelines were appropriately applied based on the administrative use of the One-Pager.

LOD ID: **WELLS RANCH USX AA T6N-R63W-S11 L01**

Consent Decree Tank System Number: **362**

**Audit Notes**

VOC Line Size: Cannot verify VOC line size from KO to burners as 3". Pp 14 of Final Packet does not provide NPS for line from KO to burners.

Separator MOP: MOP cannot be verified as 70# by Job Sheets; QC Stem Checkout (pp 19 FP) shows "fail".

**Noble Data Request Response:**

Information received from the 6th Data Request confirms: 1) A document review on 11/27/18 verified the VOC line size from KO to Burner is 3" diameter; 2) Confirmed PSHH pressure set at 70 psig using information from original file - "See item B3 on walkdown checklist and item 1 of the walkdown indicating everything was completed".

**Audit Notes**

Tornado ECD size not specified in provided documentation. Assuming ECD is 48" per Signed Engineering Evaluation (WELLS RANCH USX AA T6N-R63W-S11 L02\_SIGNED EVAL).

Pipe diameter from tanks to knock-out was documented at a 2" diameter on the field data sheets. The engineering evaluation was completed with a 3" diameter for this section.

The separator on location has pressure controlled by a pneumatic controller. The initial provided documentation did not confirm the controller shut-in pressure for the HP Separator was set to 190 psig as requested in the STEM Work Request dated 2/8/2017.

The separator pneumatic PSHH is set by the operator, not automation, and therefore no QA/QC checklist was provided to confirm the maximum pressure of the separator. The STEM One-Pager states that the separator cannot operate above 190 psig and was posted on location via item A14 of the Walkdown Checklist. This serves as confirmation of administrative controls in place to keep the separator below the maximum pressure used in the Engineering Evaluation.

Consent Decree Tank System Number: **1453**

**Audit Notes**

**Separator Max Operating Pressure**

The Field Datasheets (Final Packet, pg 22) show the separator onsite previously operated at 300 psig. The STEM Work Request Form (Final Packet, pg 5) requests the separator onsite be set to operate at no higher than 140 psig. Check #1 on the Signed Walkdown Form (Final Packet, pg 25) is checked "complete", confirming all items on the STEM Work Request Form have been completed. Therefore it is confirmed the separator onsite is set at no higher than 140 psig.

**Oil Dump Valve Size - Unknown**

Field Datasheet (Final Packet, pg 15) shows the separator onsite originally had a 2" oil dump valve with 1" trim size. The Engineering Evaluation shows a 1" oil dump valve onsite with 1/2" trim. The Job Sheet (Final Packet, pg 21) confirms the oil trim onsite was reduced to 1/2", indicating the oil dump trim size onsite is consistent with the trim size used in the Engineering Evaluation.

A 1" oil dump valve is used in the Engineering Evaluation, no documentation is provided to confirm this valve was/is installed on the separator onsite. For the given trim size, 1/2", a 2" valve could be installed and therefore the Modeling Guideline cannot be confirmed as being strictly applied. Assuming a 2" valve size on the separator, the modeled results do not show an exceedance of the vapor control system capacity.

Consent Decree Tank System Number: **1549**

**Audit Notes**

THE WALKDOWN CHECKLIST WAS NOT MARKED COMPLETE.

CB - Headspace Tank: The original work specified the creation of a headspace tank (Work Request pg. 3). The Job Sheet confirmed the creation of a headspace tank (pg. 21). Subsequent rework specified the elimination of the headspace tank to return it to full service (Work Request pg 27). The signed evaluation correctly considers no headspace tank (2 oil tanks @ 90% capacity).

CB - PSHH @ 85 psig: Subsequent rework specified the use of a pneumatic PSHH set on the hi/lo controller to be set at 85 psig. There is no confirmation in the field data that this setting was accomplished. The signed evaluation uses 85 psig as the certification max for the HP separator.

Noble has provided the following response regarding the pneumatic pshh setting on the hp; "The separator pneumatic PSHH is set by the operator, not automation, and therefore no QA/QC checklist was provided to confirm the maximum pressure of the separator. The STEM One-Pager states that the separator cannot operate above 85 psig and was posted on location via Walkdown Checklist Item A14. This serves as confirmation of administrative controls in place to keep the separator below the maximum pressure used in the Engineering Evaluation."

**Audit Notes**

A STEM Work Request required the wells be grouped together as the separators are not allowed to run simultaneously. The verbiage between the Work Request and the Job Sheet is consistent indicating the automation modifications have been completed.

The Engineering Evaluation was completed with separator maximum operating pressure of 140 psig. The STEM Work Request to control the pneumatic controller for the Hi/Lo valve to shut in at 140 psig line pressure. No documentation was provided to indicate the set points were modified or confirmed to 140 psig.

Consent Decree Tank System Number: **1455**

**Audit Notes**

The walkdown checklist (WELLS RANCH USX BB T5N-R63W-S3 L03\_WALKDOWN) was not marked as being complete. Completion was verified through other documentation in the final packet (WELLS RANCH USX BB T5N-R63W-S3 L03\_FINAL PACKET).

The STEM work request (WELLS RANCH USX BB T5N-R63W-S3 L03\_FINAL PACKET, p 3) requests that a new D-grade LP Separator be installed on the site. The Job sheet (WELLS RANCH USX BB T5N-R63W-S3 L03\_FINAL PACKET, p 22) confirms a new 270# LP separator was installed on the site. A1 from the walkdown checklist (WELLS RANCH USX BB T5N-R63W-S3 L03\_WALKDOWN, p 1) was used to confirm the trim is 1/2". There was no documentation to confirm the valve size, therefore a 2" valve size was used in the model to be conservative. It is unknown if the modeling guideline was strictly applied.

Consent Decree Tank System Number: **1529**

**Audit Notes**

A new LP separator was brought on-site to develop a HP-LP train. Could not verify the oil dump valve size (2" or 1") of the new LP separator. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim.

It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

The STEM Work Request indicated the 2" VOC line on the top of the oil storage tanks to the KO pot was to be replaced with a 3" line. There is no confirmation the piping modification occurred. The Engineering Evaluation was completed with a 3" NPS for this section of pipe.

Noble provided information on 12/10/2018 indicating a "Field verification for this facility was completed on or around 4/12/2016, field verification confirmed that the 3" VOC line from the tank to the KO was installed." The Engineering Design Standard was appropriately applied based on the provided field verification information.

Consent Decree Tank System Number: **332**

**Audit Notes**

The Engineering Evaluation did not include breathing losses from the non-production accepting tank bank. The facility configuration has two banks - one bank with three (3) oil tanks, and another bank with three (3) oil tanks. By excluding the breathing losses from the non-production accepting bank which continues to store oil, the correct application of the Modeling Guidelines cannot be verified.

The Engineering Evaluation was provided for the tank bank with two production accepting tanks and the TLO headspace tank. The other bank has three production accepting tanks. Noble provided additional information in a letter dated 3/27/2020 explaining that the headspace tank is used for both banks due to the way the piping and valving is set up.

The Work Request indicated the PSHH for the LP Separators was to be set to 70 psig triggering a wellhead shut-in. There is no confirmation in the provided documentation that the setpoint was implemented for the LP separator. The Automation QC Form only indicates the Compressor ESD was verified.

Can not verify the Modeling Guidelines have been correctly applied.

**Vapor Surge Vessel**

Noble confirmed via data request received on 12/10/2018 that field verification for this facility was completed on or around 9/30/2015 and that it was confirmed that one (1) tank was converted to a headspace tank.

**Oil Dump Valve Size - Unknown**

Jobsheet (Final Packet, pg 18) indicates a new separator was installed onsite and also indicates a 1/4" oil dump trim was installed in the separator. No documentation is provided to indicate the oil dump valve size installed in the separator onsite.

A 2" oil dump valve is used in the Engineering Evaluation, no documentation is provided to confirm this valve was/is installed on the HP separator. For the given trim size, 1/4", a 2" valve is the largest that could be installed (most conservative) and therefore the modeling guideline can be confirmed as being followed.

**Audit Notes**

**1. Field Datasheets**

The Field Datasheets (Final Packet, pg 23-29) are not dated. Assumed the date is the same as Facility Scouting date (12/4/2015).

**2. Facility walkdown checklist inconsistency**

Item C13 of the Walkdown Checklist (Final Packet, pg 17) is marked "yes" indicating the LP separator can produce into all tanks. The Stem Work Request (Final Packet, pg 5) and Job Sheet (Final Packet, pg 41) indicate one tank is disconnected from the oil fill line and serves as a headspace-only tank.

Given this inconsistency, the Walkdown Checklist has not been used as confirmation of changes on site.

LOD ID: **WERTZ FED T4N-R66W-S12 L01**

Consent Decree Tank System Number: **116**

**Audit Notes**

The walkdown checklist (WERTZ FED T4N-R66W-S12 L01\_WALKDOWN) was not marked as being complete. Completion was verified through other documents in the final packet (WERTZ FED T4N-R66W-S12 L01\_FINAL PACKET).

The STEM work request document (WERTZ FED T4N-R66W-S12 L01\_FINAL PACKET, p 3) requests that the existing Cimarron 30" combustor be replaced with a B-grade tank burner to be connected to the tank VOC header. The removed equipment form (WERTZ FED T4N-R66W-S12 L01\_FINAL PACKET, p 22) confirms the 30" Cimarron was removed from the site and a Tornado 48" tank burner was installed on 12/2/2016. However, the job sheet (WERTZ FED T4N-R66W-S12 L01\_FINAL PACKET, p 21) states that a 48" LEED was installed on 12/8/2016 when the 30" Cimarron was removed. The signed evaluation (WERTZ FED T4N-R66W-S12 L01\_SIGNED EVAL, p 2) and model (WERTZ FED T4N-R66W-S12 L01\_STEM Engineering Evaluation\_rev1) were both run using the 48" Tornado burner. The 48" Leed has a higher capacity than a 48" Tornado. The facility has an actual burner capacity that is greater than the model. Therefore the engineering design standard is still strictly followed.

The Jobsheets (Final Packet, pg 22) indicate one of the existing separators on site was converted to LP separator. The field data sheets (Final Packet, pg 14) show both existing separators had 1" valve body size. Item A1 of the STEM Walkdown Checklist (Final Packet, pg 5) is checked "yes" indicating the oil dump trim is consistent with the Engineering Evaluation, and is therefore 1/2". Both the oil body dump valve and trim size are therefore confirmed.

**Audit Notes**

**1. Field Datasheets are not dated**

The Field Datasheets (Final Packet, pg 4-9) are not dated. Date assumed to be same as Facility Scouting Date (8/13/2015).

**2. Vapor Surge Vessel Onsite - Request Confirmation**

Due to out of date of documentation (See audit note #2 above), SLR is not able to confirm a vapor surge vessel onsite

**Request confirmation of (1) 300bbl vapor surge vessel onsite.**

**UPDATE 12/13/2018 - Noble confirmed via data request that field verification for this site was completed on or around 7/10/2017 and confirms one (1) tank was converted to a headspace tank.**

<b>Total</b>	<b>15,991</b>	<b>15,989</b>

**Engineering Evaluation Verification Audit**  
Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **ZIGGY USX T7N-R64W-S19 L01**

Consent Decree Tank System Number: **1890**

**Audit Notes**

The walkdown checklist (ZIGGY USX T7N-R64W-S19 L01\_WALKDOWN) was not marked as being complete. Completion was verified through other documentation in the final packet (ZIGGY USX T7N-R64W-S19 L01\_FINAL PACKET)

The STEM work request (ZIGGY USX T7N-R64W-S19 L01\_FINAL PACKET, p 3) requests that a new D-grade LP separator be installed on the site. The Job sheet (ZIGGY USX T7N-R64W-S19 L01\_FINAL PACKET, p 24) & Separator sheet (ZIGGY USX T7N-R64W-S19 L01\_FINAL PACKET, p 26) confirm a new LEED separator was installed. A1 from the walkdown checklist (ZIGGY USX T7N-R64W-S19 L01\_WALKDOWN, p 1) confirms the trim size is 1". The valve size was not confirmed, therefore a 2" valve was used in the model to be conservative. This corresponds to the STEM Work request document (ZIGGY USX T7N-R64W-S19 L01\_FINAL PACKET, p 3) which requested a 2" valve with 1" trim be installed. This is the same size valve as was used in the signed evaluation.

There is no diameter of the VOC line from the tanks to the knockout in the field data sheet in the final packet. The Signed Evaluation lists a size of 3". The data request response from 12/10/2018 confirmed the VOC diameter from the KO to the burner is 3".
