Consent Decree Tank System Number: **329**

**Audit Notes**

CAB - It appears that breathing losses were not properly accounted for in the model because Noble considered only 3 of the 9 oil tanks in their evaluation. In reality all 9 tanks are produced to and would experience breathing losses that the vapor collection system will have to accommodate. The Modeling Guidance was not properly applied. For these reasons this site has been selected for IR camera inspection.

Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **70 Ranch T5N-R63W-S25 L02**

Consent Decree Tank System Number: **328**

**Audit Notes**

The NEI Engineering Evaluation was completed with 3" NPS for the Tanks to KO VCS piping, 4" NPS for the KO to Burner VCS piping, and 2" NPS for the Main Header to Burner Inlet VCS piping. Field Datasheets indicate the Tank to KO VCS piping is 4" NPS, KO to Burner VCS piping has an unknown NPS, and the Main Header to Burner Inlet VCS piping is 3" NPS. The Engineering Design Standard may not be strictly applied if the KO to Burner VCS piping is greater than 4" NPS.

NEI submitted a revised Engineering Evaluation on June 28, 2018 with 3" NPS for the Tanks to KO VCS piping, 3" NPS for the KO to Burner VCS piping, and 2" NPS for the Main Header to Burner Inlet VCS piping. The Engineering Evaluation and the Field Data indicate a conservative approach, thus the Engineering Design Standard appears to be appropriately applied.

Consent Decree Tank System Number: **331**

**Audit Notes**

CB - Line size from tanks to KO: The system is constructed with two line sizes. A portion is 2" diameter and another portion is 3" diameter. The initial review and Noble's evaluation used the 3" diameter. To be conservative, for evaluation purposes, 2" was used for the VOC Line Size (Tanks to KO). The engineering design standard in this case has not be strictly followed.

The VOC line from the KO to the burners consists of two lines one that is 2" and one that is 3". The signed evaluation was completed with a 4" line. This is conservative because a 4" line has less flow area than the 3" and 2" line combined.

CB - Water tanks are not included in the analysis because they are not connected to vapor collection system.

This site has been selected for IR camera inspection due to th engineering design standard not being strictly followed.

LOD ID: **70 RANCH USX T5N-R63W-S9 L05**

Consent Decree Tank System Number: **330**

**Audit Notes**

There is no request to limit tank fill levels to 75% in either the Work Order request or the TLO documentation. The evaluation was completed with tanks limited to 75%.

Noble provided additional information including an email chain, beginning on January 12, 2018, confirming the "Tank kill set is at 75% in all four oil tanks and shuts in both wells." The provided documentation confirms the appropriate application of the Engineering Design Standard.

**Audit Notes**

The Work Request indicated the oil dump valves on Separators 3 & 4 were to be modified to Kimray 1400 with 1/2 inch trims. Could not verify the oil dump valve size (2" or 1") on either separator with the documentation provided. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim.

It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size. A Work Order request was issued to "bottom out" one oil tank; remove the oil fill line from the tank while keeping the tank connected to the VCS in order to be utilized as head space only. The accompanying Job Sheet did not confirm the tank was "bottomed out" and the Walkdown Checklist was not checked as complete to "Confirm all the items on the work request form have been completed." Additionally, the provided STEM Retrofit Walkdown Checklist, Item C14, was checked "yes" indicating all tank fill lines are configured to enable LP separators to produce into all tanks.

Noble provided information on 11/14/2018 indicating a "Field verification for this facility was completed on or around 9/25/2017, field verification confirmed that one tank was converted to a headspace tank." The Engineering Design Standard has been appropriately applied based on the field verification data provided.

Consent Decree Tank System Number: **634**

**Audit Notes**

-The Work Request indicates 1 oil tank should be disconnected from the fill header in order to be used for headspace. The Jobsheet indicates one tank was bottomed out, but the Walkdown Checklist is checked "yes" for all tank fill lines produced to all tanks (C13). Noble verified in a data request dated 8/14/2018 that the tank was properly disconnected to be used for headspace on or around 6/21/2016.

**Audit Notes**

The work request asked that the low pressure separator maximum normal operating pressure be set to 60 psig. However, there was no documentation confirming that this work had been completed. Noble was asked to provide sufficient documentation proving that the low pressure separator was set to 60 psig. The following is NEI response to the request for data. "The 'STEM Work Request Form' (Final Packet - page 4), 'STEM Design Confirmation Form' (Final Packet - page 9), the signed 'Vapor Control System Engineering Evaluation' (Signed Eval - page 1), the signed 'Vapor Control System Engineering Evaluation' (Final Signed STEM Plan - page 16), and 'One Pager' (laminated and posted on location) provide consistent documentation that the maximum separator operating pressure changed to 60 psig as requested. Signature on the Final Packet ensures work was executed per the 'STEM Work Request Form.'" Per Noble's response to the data request it is possible to confirm that the Engineering Design Standard was followed.

A new LP separator was brought on-site to develop a HP-LP train. Could not verify the oil dump valve size (2" or 1") of the new LP separator. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim.

It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

Consent Decree Tank System Number: **518**

**Audit Notes**

-Job sheet lists PSHH was set to 55 psig. QC Stem Checkout on Page 33 of the Final Packet lists 65 psig as the setpoint. 65 psig will result in a higher PPIVFR and is consistent with the Signed Evaluation.

-The Work Request indicated the oil dump valve was to be modified to Kimray 1400 with 1/2 inch trim. Could not verify the oil dump valve size (2" or 1") on either separator with the documentation provided. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim. It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

Consent Decree Tank System Number: **484**

**Audit Notes**

**1. Oil Dump Valve Size - Unknown**

QC STEM Checkout form (Final Packet, pg 27) indicates a separator with SN: 8522 is the LP separator which dumps to the tanks. ITEM A1 of the STEM Walkdown Checklist is checked "yes" indicating the oil dump trim size onsite is consistent with the trim size used in the Engineering Evaluation, and is therefore 1/2". No other documentation is provided to indicate what size oil dump valve is installed in this separator.

A 1" oil dump valve is used in the Engineering Evaluation, no documentation is provided to confirm this valve was/is installed on the LP separator. For the given trim size, 1/2", a 2" valve could be installed and therefore the Modeling Guideline cannot be confirmed as being strictly followed. Assuming a 2" valve size on the separator, the modeled results do not show an exceedance of the vapor control system capacity.

**Engineering Evaluation Verification Audit**  
Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **AMIGO FUEGO T4N-R64W-S1 L01**

Consent Decree Tank System Number: **712**

**Audit Notes**

**1. Field Datasheets are not dated**

The Field Datasheets (Final Packet, pg 8-13) are not dated. Date assumed to be same as Facility Scouting Date (4/29/2016).

**2. Diameter of VOC line from tank to KO - Request additional information**

The STEM Work Request Form (Final Packet, pg 3) requests that the existing 2" VOC line be replaced with a 3" VOC line from the tanks to KO pot. The Engineering Evaluation shows a 3" VOC line from tanks to KO onsite.

No documentation is provided that indicates the 3" VOC line from tanks to KO was installed onsite. If a 2" VOC line does still exist onsite and not a 3", then the control system capacity is being overestimated and the Engineering Design Standard is not being followed.

**Request confirmation of Knockout to Burner VOC line size.**

**UPDATE 11/26/2018 - Noble confirmed via data request a 3" VOC line from the tanks to the KO was installed and is currently onsite. The Engineering Design Standard is being followed correctly.**

**3. Tank Design & Engineering Controls - Tank Liquid Level**

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity should have been used for this analysis and the Engineering Design Standard has not been strictly applied.

**4. Oil Dump Valve Size - Unknown**

Jobsheet (Final Packet, pg 18) indicates a new separator was installed onsite and ITEM A1 of the STEM Walkdown Checklist (Final Packet, pg 23) is checked "yes" indicating the oil dump trim is consistent with the Engineering Evaluation, and is therefore 3/8". There is no indication of the oil dump valve size installed in the separator onsite.

A 1" oil dump valve is used in the Engineering Evaluation. Could not verify the oil dump valve size (2" or 1") on the separator with the documentation provided. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim. It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

**5. Separator Operating Pressure - Request additional data**

The Engineering Evaluation indicates the separator is set to operate at 120 psig, no documentation was provided to indicate the separator onsite is set to operate at 120 psig.

**Confirm with Noble the separator operating pressure onsite is 120 psig.**

**UPDATE 11/26/2018 - Noble confirmed via data request the maximum separator operating pressure was set to no higher than 120 psig as requested.**

## Engineering Evaluation Verification Audit

Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **ANDERSEN HEADLEY LARSON T4N-R65W-S33-L01**

Consent Decree Tank System Number: **2328**

### Audit Notes

The Job Sheet describes "the tanks were left with the HP being able to dump to both tanks, there was no head space tank left in the end, due to changes being made by production". Leaving the HP oil dumps connected to the tank fill header is contrary to STEM Work Request Item #2 of the Separator/Flowlines/Comingles section that requests "Disconnect HP oil dump from tank fill line". The Noble model doesn't consider a HP oil dump to the oil tanks. Field verification for this facility was completed on or around 6/20/2016, field verification confirmed that the HP separator oil dump was routed to the LP separator.

LOD ID: **ANDERSON BOHLENDER T4N-R65W-S27 L01**

Consent Decree Tank System Number: **2291**

**Audit Notes**

**Modeling Guideline and Engineering Guideline not strictly applied**

Field datasheet (Final Packet, pg 10) shows a 315 bbl oil tank onsite. This oil tank was not removed or modified and therefore still exists onsite. A 300 bbl oil tank was used in the Engineering Evaluation (Signed Eval, pg 2). Using a smaller 300 bbl vs 315 bbl oil tank results in the potential for the PPIVFR to be underestimated and therefore the Modeling Guideline was not strictly followed.

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied. Assuming zero headspace surge capacity does not show an exceedance of the vapor control system capacity.

**Oil dump valve size unknown**

The STEM Work Request (Final Packet, pg 3) requests to change the 2" oil dump valve to a 1" valve with 1/2" trim. Item A1 in the STEM Walkdown Checklist (Final Packet, pg 6) is checked "yes", indicating the oil dump valve trim is a 1/2".

A 1" oil dump valve is used in the Engineering Evaluation, no documentation is provided to confirm this valve was/is installed on the separator. For the given trim size, 1/2", a 2" valve could be installed and therefore the Modeling Guideline cannot be confirmed as being strictly followed. Assuming a 2" valve size on the separator, this scenario does not show an exceedance of the vapor control system capacity.

**Audit Notes**

Per the Work Request (ANDERSON MARLEY ROBT UPRR PANAM T4N-R65W-S33 L01\_FINAL PACKET.pdf, pg. 3) a new LP Separator to be installed on site. The Job Sheet (ANDERSON MARLEY ROBT UPRR PANAM T4N-R65W-S33 L01\_FINAL PACKET.pdf, pg 35) confirms LP separator installed but does not indicate the oil dump valve size or trim. Item A1 The Final Walkdown (ANDERSON MARLEY ROBT UPRR PANAM T4N-R65W-S33 L01\_WALKDOWN.pdf, pg 1) indicates the trim is 1/2" consistent with the signed evaluation. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim. It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

**Audit Notes**

The Work Request indicated the oil dump valve on the LP separator were to be modified to Kimray 1400 with 3/8" trims. Could not verify the oil dump valve size (2" or 1") on the separator with the documentation provided. Conservatively assumed the valve to be 2", the larger available size for 3/8" trim.

It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

**Audit Notes**

-The final walkdown is not marked as being complete.

-A Work Order request was issued to "bottom out" one oil tank; remove the oil fill line from the tank while keeping the tank connected to the VCS in order to be utilized as head space only. The accompanying Job Sheet did confirm the tank was "bottomed out" but the provided STEM Retrofit Walkdown Checklist, Item C13, was checked "yes" indicating all tank fill lines are configured to enable LP separators to produce into all tanks. In a request for additional information Noble responded that "Field verification for this facility was completed on or around 8/4/16, field verification confirmed that one tank was converted into a headspace tank (i.e. removed from liquid service but remained connected to vapor header).

**Audit Notes**

NEI response to data request regarding headspace tank. Response received 5/16/2018:  
Field verification for this facility was completed on or around 7/12/16, field verification confirmed that one tank was disconnected from the fill header in order to be used as headspace.

The Work Request indicated all dump valves were to be modified to Kimray 1400 with 1/2 inch trims. Could not verify the oil dump valve modification on the separator with the documentation provided. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim.

It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

## Engineering Evaluation Verification Audit

Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **ARIEL UPRC T5N-R66W-S7 L01**

Consent Decree Tank System Number: **22**

### Audit Notes

The NEI Signed Engineering Evaluation Summary was completed with a 2" oil dump valve with a 1/2" trim. The Job Sheet in the provided Final Packet indicates the oil dump valve was changed to a 1" valve with a 1/2" trim. NEI is overestimating the dump volumes which is a conservative approach.

**Engineering Evaluation Verification Audit**  
Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **AVA ST T4N-R64W-S36 L02**

Consent Decree Tank System Number: **968**

**Audit Notes**

**1. Field Datasheets are not dated**

The Field Datasheets (Final Packet, pg 8-13) are not dated. Date assumed to be same as Facility Scouting Date (2/29/2016).

2. A Work Order request was issued to "bottom out" one oil tank; remove the oil fill line from the tank while keeping the tank connected to the VCS in order to be utilized as head space only. The accompanying Job Sheet did not confirm the tank was "bottomed out" and the Walkdown Checklist was not checked as complete to "Confirm all the items on the work request form have been completed." Additionally, the STEM Retrofit Walkdown Checklist, Item C13, was checked "yes" indicating all tank fill lines are configured to enable LP separator to produce into all tanks. The Engineering Evaluation addressed a single tank (90% maximum fill) with overflow, which is conservative. The second tank would contribute to PPIVFR (breathing loss), but such contribution would be negligible. The Modeling Guideline and Engineering Evaluation were therefore correctly (conservatively) applied.

**3. Diameter of VOC line Tanks to KO Pot - Request additional information**

The STEM Work Request Form (Final Packet, pg 3) requests that the existing 2" VOC line be replaced with a 3" VOC line from the tanks to KO pot. The Engineering Evaluation shows a 3" VOC line from tanks to KO onsite.

No documentation is provided that indicates the 3" VOC line from tanks to KO was installed onsite. If a 2" VOC line does still exist onsite and not a 3", then the control system capacity is being overestimated and the Engineering Design Standard is not being followed.

**Request confirmation of 3-inch VOC line size from tank(s) to Knockout.**

**Update 11/26/2018 - Noble confirmed via data request a 3" VOC line from Tanks to KO does currently exist onsite.**

**4. Separator Operating Pressure - Modeling Guideline Not Followed**

The QC STEM Checkout form (Final Packet, pg 23) indicates the LP separator installed onsite is set to operate at 70 psi. The Engineering Evaluation indicates the separator is set to operate at 60 psi, no documentation is provided to indicate the separator is set to operate at 60 psi. With the actual onsite separator pressure higher than the pressure in the Engineering Evaluation, the PPIVFR is being underestimated.

The Engineering Evaluation is dated 10/3/2017, the QC STEM Checkout is dated 8/8/2017 and the Signed Walkdown is dated 9/12/2017. It appears the Engineering Evaluation may have been updated, however no supporting documentation was provided to indicate the changes in the updated Engineering Evaluation were completed. Therefore the modeling guideline is not being followed.

**5. Burner Make/Model.**

The STEM WORK REQUEST FORM and the JOB SHEET specified that the existing Tornado tank burner be removed and replaced with a new Leed EC48-25. The STEM DESIGN CONFIRMATION FORM and STEM ENGINEERING EVALUATION list a Tornado 48" tank burner. Whether or not the burner was replaced, the Tornado burner has the lowest capacity in comparison with the Leed EC48-25. Consequently, the design evaluation indicating adequate design is conservative.

Consent Decree Tank System Number: 497

**Audit Notes**

The single oil tank fill level was certified to 90% with equalizer height as the control method. A single tank is unable to limit fill level via equalizer height and must utilize other means (level switch with production shutdown, etc.) for tank level control. Zero headspace surge capacity was accounted for in NEI's Engineering Evaluation, so the Engineering Design Standard has not been misapplied.

Email from automation group dated 8/22/2017 indicated the PSHH was set to 70 psig, which coincides with the work request dated 5/25/2017. The provided signed engineering evaluation, dated 9/6/2017, was completed with a LP separator pressure of 60 psig. Noble provided additional information in a letter dated 3/27/2020 demonstrating that the PSHH was set to 60 psig on 9/12/2017.

**Consent Decree Tank System Number:** **442**

**Audit Notes**

The walk down checklist (BAKER CLYNCKE ST T5N-R64W-S36 L01\_WALKDOWN) was not marked as complete. Completion was verified through other documentation in the final packet (BAKER CLYNCKE ST T5N-R64W-S36 L01\_FINAL PACKET).

The QC stem checklist (BAKER CLYNCKE ST T5N-R64W-S36 L01\_FINAL PACKET, p 20) dated 5/11/2016 states the PSHH was set to 70 psig. However, the job sheet (BAKER CLYNCKE ST T5N-R64W-S36 L01\_FINAL PACKET, p 21) dated 5/3/2016-5/12/2016 describes setting the Versa Valve to 65 psig. The signed evaluation was completed with the PSHH at 70 psig. Because 70 psig is the most conservative value the modeling guideline is considered to be strictly followed.

The field data sheet (BAKER CLYNCKE ST T5N-R64W-S36 L01\_FINAL PACKET, p 13) lists the VOC line from the KO to the burner as 2". The job sheet (BAKER CLYNCKE ST T5N-R64W-S36 L01\_FINAL PACKET, p 21) confirms a 2" underground line was removed. There is no confirmation that the line from the KO to the burner was replaced. This contradicts the signed evaluation (BAKER CLYNCKE ST T5N-R64W-S36 L01\_SIGNED EVAL, p 2) which states the line is 4". In response to a data request Noble replied "Field verification for this facility was completed on or around 6/13/2016, field verification confirmed that the 4" AGL from the KO to the burner was installed" confirming the VOC line from the KO to the burner is 4".

Consent Decree Tank System Number: **671**

**Audit Notes**

-The work request (Final Packet pg. 3) states that the valve and trim size on the remaining separator should be changed from a 2" to a 1" with a 1/2" trim. Item A1 of the Walkdown Checklist (Walkdown pg. 1) indicates that the trim was changed to 1/2". There is no verification that the valve size was reduced as requested. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim. It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

-The work request (Final Packet pg. 3) states that the Automated PSHH on the low pressure side of the HLP separator was to be set to 60 psig. There is no verification in the original documentation that this work was completed. In response to a request for additional data Noble replied "Field verification for this facility was completed on or around 8/19/2015, field verification confirmed that the HLP LP separator was set at 60 psig as requested." This confirms the work was completed.

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

**Audit Notes**

The site sketch on Page 10 of the final packet appears to show the water tanks are connected to the same VCS system as the oil tanks. Rest of documentation seems to indicate that the water tanks have their own VCS piping and burner. Additional data was requested and Noble replied that "Field verification for this facility was completed on or around 7/17/2017, field verification confirmed that the two water tanks are not connected to the oil tank VCS System."

The Field Data Sheets state the gas outlet on the LP Separators is routed to oil dumps. Additional data was requested to confirm if this was changed. In response Noble state that "An engineering review of this facility was completed on or around 9/11/2018, this review confirmed that the LP gas outlet is routed to the dumps." Noble also submitted a new signed evaluation dated 4/12/2018, a new work request dated 3/14/2018 and a new walkdown checklist (undated). The new work request specifies that the pneumatic PSHH on the HP be set to 230 psig and that two additional tanks be converted to headspace tanks. All of the work was confirmed to be completed

Consent Decree Tank System Number: **1712**

**Audit Notes**

**Single Tank Battery**

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis which resulted in the system not being adequately designed according to Noble calculations. The system is adequately designed according to SLR calculations. The Engineering Design Standard has not been strictly applied.

**Audit Notes**

-The Walkdown Checklist was not marked complete.

-The STEM Work Request Form states the pneumatic PSHH for the HP HI/LO was to be set at no higher than 190 psig, however there is no confirmation that this work was completed. Noble provided a response to the above discrepancy on 11/14/2018 that states "Rework was completed on or around 8/15/2018, which increased the HP separator pressure to no higher than 270 psig." Documentation of completed rework was also submitted which provided verification that the rework was completed.

**Audit Notes**

**Equalizer Height on Single Tank**

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. However the signed eval calculated the surge capacity at 0, so the Engineering Design Standard is considered strictly applied.

LOD ID: **BAY ROUSE USX T7N-R64W-S31 L01**

Consent Decree Tank System Number: **1409**

**Audit Notes**

**Field Datasheets are not dated**

The Field Datasheets (Final Packet pg 4-9) are not dated. Date assumed to be same as Facility Scouting Date (6/2/2015).

**1. Confirmation of Headspace Only Tank - Data Request**

The signed Engineering Evaluation indicated a 72% certification maximum fill level based on use of one of the five tanks as a headspace only tank. Neither the Stem Work Request Form nor the Job Sheet specified that a tank was to be "bottomed out." Additionally, the STEM Retrofit Walkdown Checklist, Item C13, was checked "yes" indicating all tank fill lines are configured to enable LP separators to produce into all tanks. No additional information was provided to confirm that one tank was isolated from liquid service, thus it is unknown whether or not the Engineering Design Standard was properly applied. **Request confirmation of (1) vapor surge tank onsite.**

**UPDATE 11-26-2018 - Noble provided documentation to confirm an oil tank was put into vapor service onsite. The Engineering Design Standard has been properly applied.**

**2. Oil Dump Valve Size**

The Engineering Evaluation uses a 2" oil dump valve with 1/2" trim on the LP Separator. The Job Sheet (Final Packet, pg 19) confirms the LP Separator onsite has been recently installed and it confirms a 1/2" oil dump trim size. Documentation is not provided which indicates the oil dump valve size is a 2" valve. Given the 1/2" trim size, a 2" valve is the largest valve that be used and is therefore will produce the highest PPIVFR as compared to a smaller valve size. Therefore SLR can confirm the Modeling Guideline is being met with a 2" dump valve size. No action required.

Consent Decree Tank System Number: **1340**

**Audit Notes**

**Single Tank Battery**

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

**Oil dump valve size unknown**

The STEM Work Request (Final Packet, pg 3) requests a new HLP separator be installed onsite as well as the oil dump valve trim size on that separator to be 1/2". The Job Sheet (Final Packet, pg 19) indicates a new HLP separator was installed onsite however the Job Sheet does indicate the valve size, its does confirm the 1/2" trim size however.

A 1" oil dump valve is used in the Engineering Evaluation, no documentation is provided to confirm this valve was/is installed on the HLP separator. For the given trim size, 1/2", a 2" valve could be installed and, therefore, the Modeling Guideline cannot be confirmed as being strictly applied. However, assuming a 2" valve size on the separator, the model does not show an exceedance of the vapor control system capacity.

**Audit Notes**

The Work Request, pg. 3 requests the existing dump valve be changed out for 1" valve with a 1/2" trim. The Job Sheet, pg. 20 of the Final Packet, indicates that the work crew "Changed out Dump." The new LP Separator oil dump valve body size is not indicated within the provided documentation. The LP Separator dump valve trim size is confirmed as 1/2" per the Walkdown Checklist, Item A1. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim. It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

The Signed Evaluation indicated tank vapor lines were to be 3" in size. The Work Request on Page 3 of the Final Packet requested the existing 2" line to be replaced with 3" line on top of the tanks. The provided documentation does not indicate this change was made. A data request received by Noble on 8/14/2018 indicates that on or around 3/14/16, field verification confirmed the 3" line from tanks to knockout drum was installed.

Consent Decree Tank System Number: **516-b**

**Audit Notes**

The field data sheets (PG 13 of FINAL PACKET pdf) verify the VOC line from tank to KO to be 2" while the stem design form (PG 7 of Final Packet pdf), signed eval, and stem engineering evaluation show that line to be 3". Nowhere in the work request does it state the line was to be changed from 2" to 3" nor does it state in the job sheets that work was completed on the VOC line from tank to ko to change from 2" to 3".

Field sheets indicate there is a 2" VOC line from tank to KO, which is smaller than the 3" used in the Evaluation; if so the Control System Capacity is overestimated, but is sufficient for peak when using 2" or 3".

Consent Decree Tank System Number: **1294/1284**

**Audit Notes**

No confirmation the VOC line on top of the tank(s) was modified to a 3" line from the original 2" line.

NEI data request response received 5/16/2018 indicated:

Field verification for this facility was completed on or around 3/22/2017, field verification confirmed that the 4" AGL line from KO to burner was installed.

A new HLP separator was brought on-site to replace the existing. Could not verify the oil dump valve size (2" or 1") of the new HLP separator. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim.

It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

LOD ID: **BEEBE MOSER UPRR T3N-R65W-S3 L01**

Consent Decree Tank System Number: **2318**

**Audit Notes**

4" VOC line was installed from KO to Burner but Noble used a 3" line in model. Using the smaller pipe diameter underestimated VCS capacity and therefore the engineering design standard was still strictly followed.

**Audit Notes**

The stem work request (PG 3 of the Final Packet) states the existing 2" VOC line on the top of the tank was to be replaced with a 3" VOC line down to the KO pot however nowhere in the Job Sheets (PGs 22-26 of the Final Packet) does it confirm this task was completed  
Noble provided a response to the above discrepancy on 11/14/2018 that states "Field verification for this facility was completed on or around 4/25/2017, field verification confirmed that the 3" VOC line from the tank to the KO pot was installed."

**Audit Notes**

**1. Facility walkdown checklist inconsistencies**

The STEM Walkdown Checklist (Final Packet, pg 28) has Item C6 checked "yes" indicating that multiple HP oil dumps tie into a single LP Separator. This site consists of one HP Separator and therefore multiple HP oil dumps do not exist onsite and therefore Item C6 is incorrectly checked "yes".

**2. Inconsistent Separator Max Operating Pressure**

The STEM Work Request (Final Packet, pg 3) requests the LP Separator be set to operate at 70 psi and the Engineering Evaluation (Signed Eval, pg 2) shows the max LP Separator pressure to be set at 70 psi. The QC STEM Checkout (Final Packet, pg 25) shows the LP Separator is set at 65 psi. A 65 psi LP Separator set pressure will overestimate PPIVFR as compared to a 70 psi set pressure, therefore Noble is meeting the Modeling Guideline.

**3. Unknown Oil Dump valve size and trim size - Request additional data**

A new LP Separator was installed onsite with an unknown oil dump valve and trim size. The STEM Work Request Form (Final Packet, pg 3) requests a 3/8" oil dump valve trim to be installed. No documentation is provided to confirm a 3/8" oil dump valve trim in the separator.

A 1" oil dump valve was used in Noble's Engineering Evaluation for this site, no documentation is provided to confirm a 1" oil dump valve is currently onsite.

**Request additional data to confirm oil dump valve size and trim size** - Item A1 of the STEM Walkdown Checklist (Final Packet, pg 26) indicates the oil dump valve trim used in the evaluation is accurate. Due to SLR putting in the effort to request the oil dump valve size, SLR is also requesting the valve trim size be confirmed beyond Item A1 in the Walkdown Checklist.

**4. Combustors - Documentation does not show existing combustor onsite as being removed**

Field Datasheet (Final Packet pg 14) shows an existing LEED combustor previously onsite. The STEM Work Request (Final Packet, pg 3) request the existing LEED burner be replaced with a LEED EC48-2S burner and the Job Sheet (Final Packet pg 20-21) confirm the new LEED EC48-2S was installed onsite. No documentation is provided to show the existing LEED combustor was disconnected and removed from site. Given the above information SLR determined number and model of combustors onsite to be correct and accurate.

**5. Field Datasheets**

The Field Datasheets (Final Packet pg 10-15) are not dated. Assumed the date is the same as Facility Scouting date (9/2/2016).

**Audit Notes**

**Vapor Surge Vessel - Request Additional Data**

The Engineering Evaluation indicates (2) tanks are onsite, (1) being an oil tank and the other being a vapor surge vessel. The Signed Walkdown (Final Packet, pg 28) confirms (2) tanks onsite, however check C14 of the STEM Walkdown Checklist is checked "yes" indicating the separator onsite is configured to be able to produce into all tanks onsite. This indicates that a vapor surge vessel is not currently onsite.

**Request confirmation of a vapor surge vessel onsite.**

**UPDATE 12/13/2018 - Nobel confirmed via data request that an existing oil tank onsite was converted to a vapor surge vessel, and therefore a vapor surge vessel does exist onsite.**

**LOD ID:** **BERNHARDT KAMMERZELL GREENHEAD T4N-R66W-S7 L01**

**Consent Decree Tank System Number:** **175**

**Audit Notes**

The walkdown checklist was not marked as complete. Completion was verified through other documentation in the final packet.

The Job sheet (5/11/16 BERNHARDT KAMMERZELL GREENHEAD T4N-R66W-S7 L01\_FINAL PACKET, p 23) states the PSHH should be set to 60 psig. The signed eval (6/27/16 BERNHARDT KAMMERZELL GREENHEAD T4N-R66W-S7 L01\_SIGNED EVAL, p 2) & QC Stem Checkout (5/23/16 BERNHARDT KAMMERZELL GREENHEAD T4N-R66W-S7 L01\_FINAL PACKET, p 27 ) states it was set to 70 psig. The STEM model was run at 70 psig. While considered inconsistent for inventory purposes, this does not lead to an underestimation in PPIVF.

The Jobsheet (5/11/16 BERNHARDT KAMMERZELL GREENHEAD T4N-R66W-S7 L01\_FINAL PACKET, p 23) states one oil tank was converted to a headspace tank. Since the max fill of the oil tanks is 90% of capacity, the max capacity with the new headspace tank should be 45%, but was completed in the Engineering Evaluation at 50%. This leads to an underestimation of Control System Capacity.

LOD ID: **BETZ REICHERT T4N-R65W-S9 L01**

Consent Decree Tank System Number: **258**

**Audit Notes**

-Water tanks are not controlled by flare, per Field Datasheet Drawing, P. 11 of FINAL PACKET  
-Site Modified to have LP and HP Separator, instead of 2 HP seps.  
-1 Vapor Space Tank. Only used 1 OT (out of 2) in calcs.  
-Unclear: Job Sheet (p. 21 of FINAL PACKET), states: "Installed 4" AGL to VOC Burner." The SIGNED EVAL shows that the 4" AGL is only from KO to Burner. As this is conservative, and Job Sheet was unclear, assumed 4" line was installed from KO to Burner, and not for all VCS lines.

**Audit Notes**

-A new LP separator was brought on-site to develop a HP-LP train. Could not verify the oil dump valve size (2" or 1") of the new LP separator. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim. It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

LOD ID: **BILL T6N-R65W-S36 L01**

Consent Decree Tank System Number: **1961**

**Audit Notes**

The field notes (FINAL PACKET pg. 6) show that one of the water tanks was connected to the VCS. This is not accounted for in the signed evaluation, and there is no verification that it has been taken out of service (FINAL PACKET pg. 14-26). In response to a data request, Noble provided additional data on 5/18/2018 that no water tanks are connected to the VCS.

There was a work request to disconnect 1 tank from the fill header in order to be used for headspace. The Jobsheet does not indicate that one tank was bottomed out. In response to a data request, Noble provided additional data on 5/18/2018 confirming that one tank was disconnected from the fill header in order to be used as headspace tank.

Consent Decree Tank System Number: **173**

**Audit Notes**

The walkdown checklist was not marked as complete. Completion was verified through other documentation in the final packet.

The job sheet (5/11/16 BIRD ZABKA T4N-R66W-S20 L01\_FINAL PACKET, p 23) states the PSHH should be set to 60 psig. The signed eval (6/27/16 BIRD ZABKA T4N-R66W-S20 L01\_SIGNED EVAL, p 2) & QC Stem Checkout (5/18/16 BIRD ZABKA T4N-R66W-S20 L01\_FINAL PACKET, p 28 ) states it was set to 70 psig. The STEM model was run at 70 psig.

**Consent Decree Tank System Number:** **719/720**

**Audit Notes**

The walkdown checklist not marked as being completed. The site was verified through other supplied documentation in the final packet.

Per the Work Request (BOEHNER T4N-R65W-S8 L02 & BOEHNER T4N-R65W-S8 L03\_FINAL PACKET.pdf, pg. 5) a new LP Separator was to be installed on site. The job sheet (BOEHNER T4N-R65W-S8 L02 & BOEHNER T4N-R65W-S8 L03\_FINAL PACKET.pdf, pg 31) confirms a LP separator was installed but it does not indicate the oil dump valve size or trim. A1 of the Final Walkdown (BOEHNER T4N-R65W-S8 L02 & BOEHNER T4N-R65W-S8 L03\_FINAL PACKET.pdf, pg 37) indicates the trim has been verified, but no documentation on the actual valve size. A 2" valve was used in these calculations to be conservative. It is unknown if the modeling guideline was strictly followed for the tank system.

Consent Decree Tank System Number: **820/818**

**Audit Notes**

**Oil Dump Valve Size - Unknown**

Field Datasheets (Final Packet, pg 29) shows the separator (SN: 22831) originally had a 2" oil dump valve with unknown trim size. ITEM A1 of the STEM Walkdown Checklist (Final Packet, pg 52) is checked "yes" indicating the oil dump trim size onsite is consistent with the trim size used in the Engineering Evaluation, and is therefore a 1/2".

A 1" oil dump valve is used in the Engineering Evaluation, no documentation is provided to confirm a 1" valve was/is installed on the HLP separator. For the given trim size, 1/2", a 2" valve could be installed and therefore the Modeling Guideline cannot be confirmed as being strictly applied. Assuming a 2" valve size on the separator, the modeled results do not show an exceedance of the vapor control system capacity.

**Single Tank Battery**

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

**Audit Notes**

The stem work request (PG 3 of Final Packet pdf) stated to replace the existing 2100 dump valves with 1" 1400 with 1/2" trim however in the job sheets (PG 21 of Final Packet pdf) it is confirmed only the trim was changed to 1/2". The stem engineering evaluation verifies the the dump valve did not change and is still 2".

Verification of (1) 300 bbl oil tank being bottomed out for headspace was not provided. A request for this verification was submitted.

On 5/16/2018 data was received that confirmed that the tank was bottomed out for headspace.

Field verification for this facility was completed on or around 8/2/2016, field verification confirmed that one tank was bottomed out in order to be used for headspace.

**Audit Notes**

The field data sheets (PG 28 of FINAL PACKET pdf) verify the VOC line from KO to burner to be 3" while the job sheets verify a new 4" line was installed. However the signed eval, and stem engineering evaluation show that line to be 3" and the site was modeled as such. While the documented data is conflicting it is safe to say the site is evaluated correctly and is more conservative using the 3" line in the model as opposed to the 4" line. VCS capacity is acceptable for PPIVFR modeling with 3" and 4" line size. VCS may have been underestimated using the 3".

**Audit Notes**

BOOTH T4N-R64W-S26 L01 & PROSPECT T4N-R64W-S26 L01\_WALKDOWN.pdf is not checked as complete. Pg 31 of BOOTH T4N-R64W-S26 L01 & PROSPECT T4N-R64W-S26 L01\_FINAL PACKET.pdf confirms most work in the STEM work request form (pg 5 of BOOTH T4N-R64W-S26 L01 & PROSPECT T4N-R64W-S26 L01\_FINAL PACKET.pdf) was completed. Given documents provided by Noble, SLR is unable to confirm that the 140 psig Sep max operating pressure is currently set onsite. Requested confirmation of pressure setpoint.

**UPDATE FROM NOBLE:** An engineering evaluation was completed on or around 5/10/2018, this review confirmed that the separator pressure is set at 140. The N/A is specific to the LP header, there is no LP header so the N/A seen in the documentation is accurate.

LOD ID: **BORN SITZMAN FOOS T4N-R64W-S27 L01**

Consent Decree Tank System Number: **486**

**Audit Notes**

**1. Field Datasheets**

The Field Datasheets (Final Packet, pg 11-16) are not dated. Assumed the date is the same as Facility Scouting date (3/22/2016).

**2. Facility walkdown checklist inconsistencies**

The Signed Walkdown (Final Packet, pg 20) indicates the tanks are banked onsite, the Job Sheet (Final Packet, pg 21) explains there are commingled oil dumps to a common tank header which produces to all liquid service oil tanks onsite. Therefore tanks are not currently banked onsite and the Signed Walkdown checked yes for "Tank Banking" appears to have been an error.

Item C13 of the Walkdown Checklist (Final Packet, pg 7) is checked "yes", indicating all tank fill lines are configured to enable the LP Separator to produce into all tanks. Two oil tanks onsite were converted to vapor surge vessels, see Job Sheet (Final Packet, pg 21, therefore it is not possible for the LP Separators to produce into all tanks onsite.

***Noble Update 8/15/2018 - An engineering review of this facility was completed on or around 7/12/2018, this review confirmed that two tanks were converted into a headspace tank (i.e. removed from liquid service but remained connected to vapor header).***

**3. Oil dump valve trim size unknown - Request additional information from Noble**

The STEM Work Request (Final Packet, pg 3) requests the oil dump valve trim sizes onsite be confirmed at 1" trim. The only documentation which indicates the oil dump trim size is correct is item A1 on the STEM Walkdown Checklist (Final Packet, pg 5) is checked "yes", however, due to the inconsistencies noted above the checklist is not being used for verification purposes. No other information observed to verify dump valve trim sizes.

**Request additional data from Noble to confirm the oil dump valve trim sizes onsite.**

***Update 8/15/2018 - The Walkdown Checklist confirms the 1" oil dump valve trim onsite.***

**Audit Notes**

Conflicting information on Maximum Operating Pressure of separator:

- >A separator pressure of 65 psig was used in the STEM evaluation.
- >The Job Sheet noted a setting of 55 psig.
- >The QC Stem Checkout sheet noted the PSHH switch was calibrated at 65 psig.

Field data sheet was not dated. Assumed the date is the same as Facility Scouting date (5/6/16).

The Field Data Sheet (Final Packet, Pg 15) indicates The HLP Separator replaces the HP Separator. The HLP has 2" 212 SMA valve. There is no indication on the Job Sheet or in any additional provided documentation the valve body was updated to the 1" 1400.

Consent Decree Tank System Number: **106**

**Audit Notes**

The Job Sheet and Work Request indicate a single tank is to be removed from storage service and used as a vapor headspace. This should be a 75% tank full level. The evaluation was completed with a 60% tank full level, indicating two (2) tanks are being used as vapor headspace. Confirmation needed on how many tanks are in headspace service only.

NEI response to data request regarding number of headspace tanks. Data provided 8/14/2018:  
Rework was completed for this facility on or about 6/27/16 that converted an additional oil tank into a headspace tank, the completed rework packet is provided in this 3rd Information Request Response titled 102\_BOULTER ST T4N-R65W-S16 L01\_COMPLETED REWORK.

LOD ID: **BOULTER T4N-R65W-S11 L03**

Consent Decree Tank System Number: 251

**Audit Notes**

The STEM Work Request Form, Field Data Sheets and Job Sheets do not indicate that the water tanks are controlled with the VCS. However, Noble's STEM Engineering Evaluation includes HP (300#) and LP (70#) water dumps. No water tanks are included in the evaluation. There are three 60 bbl water tanks (pg. 23 & 25). From the documentation, the water dump valves shouldn't be included. This is a discrepancy that over estimates volume of generated vapor.

The vapor headspace percentage considered in the Noble model was not correct. The value entered was 68%. It should have been 60%. Again this is a conservative correction that provides more headspace than considered in the original evaluation.

The Noble work on this evaluation was inconsistent and did not follow their published guidelines, however considering the available documentation, it is SLR's opinion that the VCS is adequately designed. No additional information is needed for this facility.

Consent Decree Tank System Number: 142

**Audit Notes**

A Work Order request was issued to "bottom out" one oil tank; remove the oil fill line from the tank while keeping the tank connected to the VCS in order to be utilized as head space only. The accompanying Job Sheet did not confirm the tank was "bottomed out" and the Walkdown Checklist was not checked as complete to "Confirm all the items on the work request form have been completed." Additionally, the provided STEM Retrofit Walkdown Checklist, Item C13, was checked "yes" indicating all tank fill lines are configured to enable LP separators to produce into all tanks.

NEIs response to a follow up data request regarding the headspace tank is below. Data received 5/16/2018: Field verification for this facility was completed on or around 3/2/2016, field verification confirmed that one tank was disconnected from the fill header in order to be used as headspace.

The NEI Engineering Evaluation was completed with 2 tanks instead of 3. The Signed Engineering Evaluation Summary was hard typed over with 3 on the No. of Tanks field, while the calculations page indicated it was 2 at 60%. This impacts the breathing losses resulting in a lower estimated PPIVFR. The Modeling Guidelines can not be confirmed as strictly applied.

**Audit Notes**

No confirmation of the oil dump valve size for the new LP separators or for the existing HLP which had a Kimray 212 SMA. Since Item A1 in the walkdown sheet was checked "Yes", the model was updated and run with 2" valves with the confirmed 1/2" trims. It is unknown if the Modeling Guidelines were followed.

**Audit Notes**

The IR Camera Inspections were performed 10/27/2015, 3 months prior to the QC of the PSHH at this site (BULLEIT FED T8N-R59W-S4 L01\_FINAL PACKET.pdf, page 24) and 2 years prior to the Signed Evaluation. For this reason this site has been selected for IR camera Inspection.

Consent Decree Tank System Number: 403

**Audit Notes**

Per the Work Request (BUTTERBALL MILE HI T3N-R64W-S19 L01\_FINAL PACKET.pdf, pg. 3) the dump valves on the HLP separator were to be replaced with a 1" valve with 1/2" trim. The Job Sheet (BUTTERBALL MILE HI T3N-R64W-S19 L01\_FINAL PACKET.pdf, pg 35) does not include a reference to replacement of the dump valves or trim. The Final Walkdown (BUTTERBALL MILE HI T3N-R64W-S19 L01\_WALKDOWN.pdf, pg 1) indicates the trim has been verified, but no documentation on the actual valve size is included. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim. It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

**Audit Notes**

A Work Order request was issued to "bottom out" one oil tank; remove the oil fill line from the tank while keeping the tank connected to the VCS in order to be utilized as head space only. The accompanying Job Sheet did not confirm the tank was "bottomed out" and the Walkdown Checklist was not checked as complete to "Confirm all the items on the work request form have been completed." Additionally, the provided STEM Retrofit Walkdown Checklist, Item C13, was checked "yes" indicating all tank fill lines are configured to enable LP separators to produce into all tanks.

NEI response to follow up data request regarding headspace tank provided below. Data received 8/14/2018: Field verification for this facility was completed on or around 4/8/16, field verification confirmed that one tank was converted into a headspace tank (i.e. removed from liquid service but remained connected to vapor header). Additionally, the Tank Truck Loadout Final Packet (provided in this 3rd Information Request Response titled 103\_BUTTERBALL T3N-R64W-S19 L01 TLO Final Packet) dated 11/2/16, provides additional confirmation that one tank was converted into a headspace tank.

Consent Decree Tank System Number: **523**

**Audit Notes**

The stem work request (PG 3 of Final Packet pdf) states to disconnect tanks 5 & 6 from the fill header but leave connected to the VOC header to be used as headspace tanks however nowhere in the job sheets (PGs 22-26 of Final Packet pdf) does it state this task was completed.

Noble provided a response to the above discrepancy on 11/14/2018 that states "Field verification for this facility was completed on or around 5/9/2018, field verification confirmed that two tanks were converted to headspace tanks."

**Audit Notes**

There is no request or verification that one of the tanks was bottomed out for headspace.  
On 5/16/2018 documentation was provided to verify the tank was bottomed out for headspace. The Tank Truck Loadout Final Packet (provided in this 2nd Information Request Response titled 068\_CALVARY USX T7N-R65W-S29 L01 TLO Final Packet) dated 12/21/16, provides confirmation that one tank was converted into a headspace tank.  
All equipment and emission sources properly accounted for. No need for additional information requests.

Consent Decree Tank System Number: **476**

**Audit Notes**

The stem work request (PG 3 of Final Packet pdf) states to disconnect and bottom out 1 tank from fill header but leave connected to the VOC header to be used as a headspace tank however nowhere in the job sheets (PGs 22-26 of Final Packet pdf) does it state this task was completed.

Noble provided a response to the above discrepancy on 11/14/2018 that states "Field verification for this facility was completed on or around 6/28/2017, field verification confirmed that one tank was converted to a headspace tank."

**Audit Notes**

The only documentation identifying 40 psig as the maximum operating pressure is found in Noble signed eval. Documentation found in the Final Packet indicates the PSHH for the LP separator is set to 70 psi. Noble provided additional information on 3/27/2020 in response to the draft audit report confirming the PSHH is set to 40 psig.

**Audit Notes**

No information in the provided documentation as to whether the HP oil from Carpio 22-4-19, 43 / Gruen 22-31,33,35 was routed to the LP side of the HLP separator. It appears via the automation email dated February 11, 2016, the wells in question were re-routed to the LP protions of the HLP separator.

**Audit Notes**

The separator pneumatic PSHH is set by the operator not automation and therefore no QA/QC checklist was provided to confirm the maximum pressure of the separator. The STEM One-Pager states that the separator cannot operate above 160 psig and was posted on location via item A14 of the Walkdown Checklist. This serves as confirmation of administrative controls in place to keep the separator below the maximum pressure used in the Engineering Evaluation.

LOD ID: **CDOT T5N-R65W-S1 L01**

Consent Decree Tank System Number: **1458**

**Audit Notes**

The single oil tank fill level was certified to 90% with equalizer height as the control method. A single tank is unable to limit fill level via equalizer height and must utilize other means (level switch with production shutdown, etc.) for tank level control. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

A new LP separator was installed to create an HP/LP train. There is no confirmation of the oil dump valve size associated with the new LP separator, thus a 2" valve with a 1/2" trim was included in the audit as a conservative evaluation.

**Engineering Evaluation Verification Audit**  
Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

**LOD ID:** CECIL USX T6N-R64W-S1 L03

**Consent Decree Tank System Number:** 590

**Audit Notes**

The walkdown checklist (CECIL USX T6N-R64W-S1 L03\_0237\_WALKDOWN) was not marked as being complete. Completion was verified through other documentation in the final packet (CECIL USX T6N-R64W-S1 L03\_0237\_FINAL PACKET).

The walkdown checklist (CECIL USX T6N-R64W-S1 L03\_0237\_WALKDOWN, p 4) states there are 9 oil tanks, 2 water tanks, and 1 tank that is out of service. This contradicts the signed eval (CECIL USX T6N-R64W-S1 L03\_0237\_SIGNED EVAL) which states there are 9 oil and 3 water tanks on site. The model (CECIL USX T6N-R64W-S1 L03\_STEM Engineering Evaluation\_rev1\_with TLO) was run with 12 tanks. Additional data was requested and was provided by Noble on 8/15/2018. Noble responded with an updated signed evaluation dated 7/17/2018 with 9 oil and 2 water tanks.

The work request states that the automated PSHH on the LP separators were to be set to 60 psig (CECIL USX T6N-R64W-S1 L03\_FINAL PACKET, p 3). An email from 7/29/2015 states that all 3 pressure switches were set to 60 lbs. (CECIL USX T6N-R64W-S1 L03\_FINAL PACKET, p 24). The signed eval from 12/1/2017 and 8/15/2015 has LP separator PSHH set to 70 lbs. The modeling guideline was still applied correctly since the signed evaluation overestimates actual PPIVF.

The STEM work request (CECIL USX T6N-R64W-S1 L03\_FINAL PACKET, p 3) requests the oil dump trims be reduced to 1/2". The job sheet (CECIL USX T6N-R64W-S1 L03\_FINAL PACKET, p 19) confirms both the oil and water trims were updated to 1/2". However, the signed eval (CECIL USX T6N-R64W-S1 L03\_SIGNED EVAL, p 2) and model (CECIL USX T6N-R64W-S1 L03\_STEM Engineering Evaluation\_rev1\_with TLO) were run with 1" oil trims. The modeling guideline was still applied correctly since the signed evaluation overestimates actual PPIVF.

LOD ID: **CERVI USX T4N-R63W-S23 L01**

Consent Decree Tank System Number: **457**

**Audit Notes**

The work request indicated the Cervi USX CC23-02 separator was to be converted to the LP unit in the train (Final Packet, pg 3). The Job Sheet indicated the Cervi 11-23 unit was the unit converted (Final Packet, pg 24) and the corresponding oil dump valve on this unit was a 2" 212 SMA. Audit evaluation completed with a 2" valve w/ 1/2" trim (trim confirmed via Walkdown Checklist item A1).

**Audit Notes**

**1. Field Datasheets**

The Field Datasheets (Final Packet, pg 12-17) are not dated. Assumed the date is the same as Facility Scouting date (10/20/2015).

**2. Facility walkdown checklist inconsistency**

Item C6 of the Walkdown Checklist (Final Packet, pg 10) is checked "yes", indicating multiple HP oil dumps tie into a single LP separator. There is one HP separator onsite, therefore multiple HP oil dumps is not possible on this site.

**Audit Notes**

The walkdown had to be used to verify that existing dump valves were switched from 212s to 1400s with 1" valve and 1/2" trim.

Cannot verify 2" line from tank to KO was replaced with 3" line.

Noble provided a response to the above discrepancy on 11/14/2018 that states "Field verification for this facility was completed on or around 5/8/2017; field verification confirmed that the 3" VOC line from the tank to the KO pot was installed."

Consent Decree Tank System Number: **1345**

**Audit Notes**

A new HP-LP separator was brought on-site to replace the HP separator. Could not verify the oil dump valve size (2" or 1") of the new HP-LP separator. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim. It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

Consent Decree Tank System Number: **657**

**Audit Notes**

There is no indication on the Job Sheet, Page 31 of the Final Packet, or any other provided documentation that the Tank VOC line was upgraded to 3" line from the existing 2" line. This was requested in the Work Request Form, Page 3 of the Final Packet. A data request from Noble on 8/14/2018 stated that on or around 3/14/2016 field verification confirmed 3" line was installed from the tanks to the knockout drum.

LOD ID: **CHITTENDEN T5N-R64W-32 L01**

Consent Decree Tank System Number: **2269**

**Audit Notes**

-The Work Request indicated the oil dump valve on the separator was to be modified to Kimray 1400 with 3/8 inch trim. Could not verify the oil dump valve size (2" or 1") on either separator with the documentation provided. Conservatively assumed the valve to be 2", the larger available size for 3/8" trim.

-Engineering Evaluation states the oil/condensate tank is kept at 90% using "Equalizer Height". There is no equalizer line in this case because the Tank Battery contains only one tank. The headspace surge capacity is dependent on the fill level. No headspace surge capacity was claimed for this facility therefore the Engineering Design Standard is still considered to be applied correctly.

**Audit Notes**

The walkdown checklist is not marked complete.

The stem work request form (PG 3 of FINAL PACKET pdf) states the pneumatic pssh was to be set to shut in HP HI/LO @ 55 psig in the LP separator; however, nowhere in the job sheets (PGs 20 through 27 of FINAL PACKET pdf) does it confirm this task was completed.

CB - The "Yes" response to Item B3 of the STEM Retrofit Walkdown Checklist (pg 6/29) will be used as confirmation that the PSHH was set to 55 psig in the LP separator.

No further information is required for this audit.

This site was an alternate site selected for IR Camera Inspection based upon its system pressure group ( $\geq 233$ ).

Consent Decree Tank System Number: **2327**

**Audit Notes**

**1. Facility walkdown inconsistencies**

The Signed Walkdown (Final Packet, pg 30) indicates the tanks are banked onsite and includes the comment "one bank including two tanks". This appears to be a misunderstanding of "tank banking".

Item C8 of the Walkdown Checklist (Final Packet, pg 29) indicates multiple LP oil dumps tie into a single tank fill line. According to the STEM Work Request (Final Packet, pg 3) and the Job Sheet (Final Packet, pg 22) only a single LP oil dump is connected to the tank fill line.

Due to these multiple inconsistencies in the Facility Walkdown Checklist, the checklist has been omitted as a verification source.

**2. Field Datasheets are not dated**

The Field Datasheets (Final Packet pg 11-16) are not dated. Assumed the date is the same as Facility Scouting date (3/4/2016).

**Audit Notes**

**Oil Dump Valve Size - Unknown**

Field Datasheet (Final Packet, pg 17) shows the separators onsite all originally had a 2" oil dump valve with a 1" trim size. The Engineering Evaluation shows the (2) LP separators onsite to currently have 2" oil dump valves with 3/4" trim and the (1) HLP separator onsite to have a 1" oil dump valve with 1/2" trim.

ITEM A1 of the STEM Walkdown Checklist (Final Packet, pg7) is checked "yes" indicating the oil dump trims onsite are consistent with the trim sizes used in the Engineering Evaluation.

A 1" oil dump valve is used in the Engineering Evaluation for the HLP separator onsite, no documentation is provided to confirm this valve was/is installed on the HLP separator. For the given trim size, 1/2", a 2" valve could be installed and therefore the modeling guideline cannot be confirmed as being strictly applied. Assuming a 2" valve size on the separator, the modeled results do not show an exceedance of the vapor control system capacity.

2" oil dump valves are used in the Engineering Evaluation for the (2) LP separators onsite. Field datasheets (Final Packet, pg 17) show that 2" oil dump valves previously existed on those separators. No documentation is provided indicating these oil dump valves were ever modified with different size valves, therefore it was assumed 2" oil dump valves are currently installed on the (2) LP separators onsite.

**Vapor Surge Vessels**

Noble confirmed via a data request received on 12/10/2018 that the field verification for this facility was completed on or around 4/8/2016 and it confirmed that two (2) tanks were converted to vapor surge vessels.

Consent Decree Tank System Number: 236

**Audit Notes**

The walkdown checklist was not marked as complete. Completion was verified through other documentation in the final packet.

The field data sheet (Final Packet Rework pg. 11) lists 14 oil tanks on site. The signed eval only lists 12. Additional data was provided by Noble as follows confirming there are only 12 oil tanks onsite, "An engineering review of this facility was completed on or around 7/12/2018, this review confirmed that there are 12 producing tanks that are associated with the oil VOC system. Additionally, there is one maintenance tank and one tank that was associated with a vertical well. That tank is no longer a producing tank and is not part of the oil VOC system."

It was assumed that the "Maintenance Tank" in the IR videos is not connected to the VCS. This site was selected to be re-filmed to confirm this assumption and to get another look at the VOC lines from the KO to the burner.

The facility has two banks of 6 oil tanks each. Working losses from the non-producing bank were not accounted for in the Signed Evaluation. Therefore, the Modeling Guideline was not strictly applied.

Consent Decree Tank System Number: **521**

**Audit Notes**

The walkdown checklist (CODY WHITE GUTTERSEN T3N-R64W-S3 L01\_WALKDOWN) was not marked as complete. Completion was verified through other documentation in the final packet (CODY WHITE GUTTERSEN T3N-R64W-S3 L01\_FINAL PACKET).

The Field Datasheet (CODY WHITE GUTTERSEN T3N-R64W-S3 L01\_FINAL PACKET, p 16) confirms Sep #3 has a 2" 212 SMA valve. The job sheet (CODY WHITE GUTTERSEN T3N-R64W-S3 L01\_FINAL PACKET, p 32) confirms that the valve trim was changed. The 212 SMA valve had to be swapped out for a different valve to accommodate the smaller trim size. There is no confirmation that the new valve is a 1400 as requested in the work order. It is unknown in this case if the modeling guideline was strictly applied.

Consent Decree Tank System Number: **481**

**Audit Notes**

The stem work request (PG 3 of Final Packet pdf) states to disconnect and bottom out 1 tank from fill header but leave connected to the VOC header to be used as a headspace tank however nowhere in the job sheets (PGs 21-24 of Final Packet pdf) does it state this task was completed.

Noble provided a response to the above discrepancy on 11/14/2018 that states "Field verification for this facility was completed on or around 9/20/2018, field verification confirmed that one tank was converted to a headspace tank."

Consent Decree Tank System Number: 32

**Audit Notes**

The walkdown checklist was not marked as complete. Completions were verified through other documentation in the final packet.

The site sketch (COLTRANE IGO FARMS T5N-R66W-S28 L01\_FINAL PACKET, p 11) shows 2 knockouts. The Signed eval (COLTRANE IGO FARMS T5N-R66W-S28 L01\_SIGNED EVAL, p 2) shows that there is only 1 header from the tank to the knockout. There was no documentation (FINAL PACKET, p 21) to remove the extra knockout. According to the field data sheet (COLTRANE IGO FARMS T5N-R66W-S28 L01\_FINAL PACKET, p 15) there are 2 NPS lines from the KO to burners at 120' & 210'. Therefore the Engineering Guideline was not followed.

Consent Decree Tank System Number: **1403**

**Audit Notes**

The stem work request (PG 4 of the Final Packet) states the existing 2" VOC line on the top of the tank was to be replaced with a 3" VOC line down to the KO pot however nowhere in the Job Sheets (PGs 22-26 of the Final Packet) does it confirm this task was completed

Noble provided a response to the above discrepancy on 11/14/2018 that states "Field verification for this facility was completed on or around 11/9/2016, field verification confirmed that the 3" VOC line from the tank to the KO pot was installed."

**Audit Notes**

-The Job Sheets (Final Packet pg 20 & 22) indicate a new LP separator was installed onsite. Item A1 of the Walkdown Checklist (Final Packet pg 7) indicates the correct trim size (1/2") is installed on the LP separator, however, documentation is not provided indicating the size of the oil dump valve. The Signed Eval was run with a 1" valve size, which would underestimate PPIVFR if a 2" valve were installed.

-The fill level used in the Signed Eval is 90% with the control method indicated as "Equalizer Height". A single tank would not have an equalizer line. Zero headspace capacity was used in SLR's calculations based on a single tank being able to be filled up to 100% with liquid.

LOD ID: CORNELIUS T3N-R65W-S11 L01

Consent Decree Tank System Number: 1772

**Audit Notes**

**1. Field Datasheets are not dated and are largely unreadable**

The Field Datasheets (Final Packet, pg 12-17) are undated and unreadable. Date assumed to be same as Facility Scouting Date (6/3/2016).

**2. Field Datasheets Oil Tank Size - Unreadable**

Field datasheets (Final Packet, pg 12-17) are mostly unreadable. The number and size of oil tanks cannot be confirmed via the field datasheets. Based on the provided satellite photo (Final Packet, pg 20) and the IR Camera videos, SLR is able to confirm there is (1) 400 bbl oil tank onsite.

**3. Field Datasheets VOC Line Tanks to KO - Unreadable**

Field datasheets (Final Packet, pg 12-17) are mostly unreadable. The tank to KO VOC line size cannot be confirmed as 2" via the field datasheets. No other documentation is provided to confirm this line size. However, a 2" line size is consistent with the worst-case (i.e., smallest) line size in use.

**4. Tank Design & Engineering Controls - Tank Liquid Level**

The tank system consists of a single oil tank. The signed eval states that the certification maximum is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

Consent Decree Tank System Number: **2216**

**Audit Notes**

**1. Oil dump valve size could not be verified - Request additional data**

The Job Sheet (Final Packet pg 23 & 25) indicates a new LP separator was installed onsite. Check A1 on the STEM Walkdown Checklist (Final Packet pg 5-7) indicates that the proper 1/2" trim on the oil dump valve is installed. Could not verify the oil dump valve size (2" or 1") of the new LP separator. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim. It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

**2. Field Datasheets are not dated**

The Field Datasheets (Final Packet pg 12-19) are not dated. Assumed the date is the same as Facility Scouting date (3/4/16).

Consent Decree Tank System Number: **576**

**Audit Notes**

Noble provided the following comment regarding the flash factor used for the condensate at this facility "All three (3) wells on this facility are completed in the Lyons formation. Lyons wells differ from wells completed in other formations in that the produced gas is largely inert (~90% CO<sub>2</sub> and N<sub>2</sub>). Additionally, whereas typical formations produce hydrocarbon gas that is in pressure-dependent equilibrium with the produced oil, the inert gas produced from Lyons wells is not in equilibrium with oil and is not pressure dependent.

Noble's Modeling Guideline provides several methods for applying flash factor. The most commonly applied method in Noble's Engineering Evaluations is the Valko-McCain method. Since the produced gas at the CUMMINS DILLARD JEANIE T7N-R64W-S10 L01 (TS# 576) facility is not in a pressure-dependent equilibrium with the produced oil, the Valko-McCain method of flash factor determination is not applicable. Noble utilized wellhead sampling and available permitting documentation to assign a flash factor for this location. A variety of Lyons wells were sampled across several Tank Systems, many of which detected negligible flash gas quantities. To ensure design adequacy, a conservative flash factor was assigned (4 scf/bbl), consistent with the highest measured flash factor across these locations."

The work request indicates a 4" AGL is to be installed. No confirmation on the job sheet that the upsized line was installed however the above ground line is visible in the IR Camera videos provided.

**Engineering Evaluation Verification Audit**  
Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **DABNEY SHELTON T4N-R65W-S23 L01**

Consent Decree Tank System Number: **2201**

**Audit Notes**

The single oil tank fill level was certified to 90% with equalizer height as the control method. A single tank is unable to limit fill level via equalizer height and must utilize other means (level switch with production shutdown, etc.) for tank level control. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

**Engineering Evaluation Verification Audit**  
Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **DANE FRICO REI T3N-R65W-S10 L01**

Consent Decree Tank System Number: **2105**

**Audit Notes**

**1. Field Datasheets**

The Field Datasheets (Final Packet, pg 11-16) are not dated. Assumed the date is the same as Facility Scouting date (11/6/2015).

**2. Tank Size and Fill Capacity Inconsistency - Underestimating VCS Capacity**

The Engineering Evaluation (Signed Eval pdf) was run with three 300 bbl oil tanks at a 63% max fill level (includes one empty vapor space tank). The Field Datasheets (Final Packet, pg 12) show the oil tanks onsite are 285 bbl tanks and no information was observed to suggest the tanks were modified. With one vapor space tank, a maximum fill capacity of 60% was calculated  $[(285 \text{ bbl} * 90\% \text{ max fill} * 2 \text{ tanks}) / (3 \text{ tanks} * 285 \text{ bbl})]$ . By using the 63% max fill capacity, the control system capacity is underestimated and therefore meets the Engineering Design Standard.

Note: The presence of a vapor space tank was verified using item C13 of the Walkdown Checklist (Final Packet, pg 8), being marked as "n/a", assumed to indicate all tanks cannot be filled from the separators.

**3. Oil dump valve size unknown**

The field data sheets (Final Packet, pg 14) indicates the existing HLP separators have 2" oil dump valves. The Engineering Evaluation workbook (DANE FRICO REI T3N-R65W-S10 L01\_STEM Engineering Evaluation\_rev1) was run using a 1" oil dump valve size for the Signed Evaluation. The Job Sheet (Final Packet, pg 20) specifies "Reduced oil dump", however, it is unclear if this refers to the reduction of the valve and/or the trim size as the Stem Work Request (Final Packet, pg 3) requested the oil dump valve trim be reduced to 1/2". If the 2" oil dump valves were not changed the PPIVFR is being underestimated and the Modeling Guideline cannot be confirmed. Assuming a 2" valve size on the separator does not show an exceedance of the vapor control system capacity.

The walkdown checklist is not marked complete  
The trim size of the oil dump valve on the LP cannot be confirmed as 1/2" as requested from the stem work request from (PG 3 of PDF)  
CB - Job sheets do not confirm that the LP separator LP dump valve trim size as 1/2". The positive response to Item A1 of the STEM Retrofit Walkdown Checklist will be used as confirmation that the valve trim size is consistent with the engineering evaluation.

CB - No further information is required for this evaluation.

**Audit Notes**

The stem work request (PG 3 of the Final Packet) states bring the VOC line above ground and update to 4" VOC header however nowhere in the Job Sheets (PGs 19-22 of the Final Packet) does it confirm this task was completed

Noble provided a response to the above discrepancy on 11/14/2018 that states "Field verification for this facility was completed on or around 8/27/2015, field verification confirmed that the 4" above ground VOC line was installed."

Consent Decree Tank System Number: **2173**

**Audit Notes**

1. The Work Order in the Final Packet, pg 3, indicates a tank is to be removed from liquid service and utilized in vapor service as a headspace tank. No indication on the Job Sheet, Final Packet pg 35, that the tank conversion was completed. The Final Walkdown Checklist, Item C13, does not confirm or negate the tank service conversion because it is checked as Not Applicable (N/A). Noble indicated in a data request on 2/20/2018 that on or around 9/6/2016 field confirmation verified a tank had been converted for use as vapor headspace.

2. The STEM Engineering Evaluation file provided was "Not Solved." Engaged the solver macro and obtained different headspace information for the site configuration.

### Audit Notes

A new LP separator was brought on-site to develop a HP-LP train. Could not verify the valve size (2" or 1") of the new LP separator. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim.

It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

Consent Decree Tank System Number: **363**

**Audit Notes**

Field Datasheet reports 2 LEED HOC 48" combustors. Model demonstrates with only 1 LEED 48" Gen 1 #7. While this is conservative and does not affect EDS, it is not consistent with the field data.

IR footage of "Normal" operations shows emissions release at 2:08, and appears to be coming from the tanks behind those immediately being filmed. It should be noted that only 4 of the 6 tanks were filmed and the one apparently releasing was one of the two not directly captured by the IR footage.

The NEI Evaluation was completed as though the tanks were banked in a configuration of 2 banks of 3 tanks each. The STEM Work Request, Job Sheet, and Walkdown Checklist all indicate that the tanks have been un-banked. The NEI Evaluation does not account for breathing losses from the all 6 tanks due to the banking configuration. The PPIVFR may be underestimated, thus the Modeling Guidelines were not strictly applied.

**Engineering Evaluation Verification Audit**  
Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **DEGENHART USX T6N-R62W-S17 L02**

Consent Decree Tank System Number: **1605**

**Audit Notes**

**1. Field Datasheets are not dated**

The Field Datasheets (Final Packet, pg 9-14) are not dated. Date assumed to be same as Facility Scouting Date (6/17/2015).

**2. Vapor Surge Vessel**

A Work Order request was issued to "bottom out" one oil tank; remove the oil fill line from the tank while keeping the tank connected to the VCS in order to be utilized as head space only. The accompanying Job Sheet did (did not) confirm a tank was "bottomed out" and the Walkdown Checklist was not checked as complete to "Confirm all the items on the work request form have been completed." Additionally, the STEM Retrofit Walkdown Checklist, Item C13, was checked "yes" indicating all tank fill lines are configured to enable separator to produce into all tanks. Additional information was not provided to clarify the inconsistent and conflicting information, thus it is unknown whether the Engineering Design Standard for properly applied.

**Request confirmation from Noble that one tank was bottomed out (isolated from liquid service and used as headspace only tank).**

**Update 11-26-2018 - Noble confirmed via data request that field verification confirmed one tank was converted to a headspace tank onsite.**

**3. Separator Certification Maximum Pressure - Request additional data**

The Job Sheet indicates a 300# separator was installed, replacing the previous 500# separator. The signed Engineering Evaluation indicates a Certification Maximum Pressure of 260 psi with the control method listed as "Shut-in of HP Hi/Lo."

**Confirm with Noble the separator operating pressure onsite is 260 psi.**

**Update 11-26-2018 - Noble confirmed via data request that HP Separator onsite is set to no higher than 260 psig onsite. Modeling Guideline is being followed.**

**4. Oil Dump Valve Size - Unknown**

Jobsheet (Final Packet, pg 19) indicates a new separator with a 1/2" oil trim was installed onsite. There is no indication of the oil dump valve size installed in the separator.

A 2" oil dump valve is used in the Engineering Evaluation, no documentation is provided to confirm this valve was/is installed on the HLP separator. For the given trim size, 1/2", a 2" valve is the largest (most conservative) that can be utilized and therefore the modeling guideline can be confirmed as being followed.

**Audit Notes**

Field Datasheet (DEJONG T5N-R65W-S24 L01\_FINAL PACKET, p 11) has no date but data presented make sense given data from Work Request, Job Sheet, Engineering Eval. Assuming Field Datasheet was completed prior to any work on site.

Job Sheet (DEJONG T5N-R65W-S24 L01\_FINAL PACKET p 21) states that PSHH on LP separator was set to 50 psig, however STEM Work Request Form (p 3) requests and QC STEM Checkout (p 26) confirms that PSHH was set to 60 psig. Assuming PSHH is set as designed at 60 psig.

A new LP separator was brought on-site to develop a HP-LP train. Could not verify the valve size (2" or 1") of the new LP separator. Conservatively assumed the valve to be 2", the largest available size for 1/2" trim.

It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

## Engineering Evaluation Verification Audit

Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **DEVRIES ST T6N-R64W-S36 L01**

Consent Decree Tank System Number: **1228**

### Audit Notes

The Field Datasheet (DEVRIES ST T6N-R64W-S36 L01\_FINAL PACKET, p 10) does not have a date listed however the data shown makes sense given the subsequent documentation. Assuming that the field data sheet was completed prior to any changes on site.

The Field Datasheet (DEVRIES ST T6N-R64W-S36 L01\_FINAL PACKET, p 10) lists separator oil dumps as having 1/4" trims but the Job Sheet confirms trims are 1/2", the spec listed in the Engineering Evaluation. Assuming that the Job Sheet is correct as this is the more conservative option and it meets Engineering Evaluation specifications.

NEI Evaluation was completed with one of the three tanks out of service as additional headspace. Neither the work order or the construction jobsheet indicated a tank was disabled from receiving liquids while remaining connected to the VCS. Verify tank was bottomed out for additional headspace. Information request to NEI.

NEI Responded with documentation confirming the third tank was isolated as an additional headspace tank for truck load-out. The new configuration includes an additional check valve in the VOC header. Assumed NEI pipeline hydraulics calculations account for the resulting increased pressure drop in the VOC line due to that new check valve.

**Audit Notes**

The walkdown checklist (DIETRICH T4N-R64W-S7 L01\_WALKDOWN) was not marked as being complete. Completion was verified through other documentation in the final packet (DIETRICH T4N-R64W-S7 L01\_FINAL PACKET).

The STEM work request form (DIETRICH T4N-R64W-S7 L01\_FINAL PACKET, p 3) requests the existing 212 oil dump valves to be replaced with 1" 1400 with 1/2" trim on both separators. The STEM retrofit walkdown checklist (DIETRICH T4N-R64W-S7 L01\_FINAL PACKET, p 5) A1 confirms the trim is consistent with the oil dump trim in the signed engineering eval (DIETRICH T4N-R64W-S7 L01\_SIGNED EVAL p, 2) The job sheet (DIETRICH T4N-R64W-S7 L01\_FINAL PACKET, P 22) does not mention updating the valves to 1" from 2". Therefore a 2" valve size was used in the model to be conservative.

The STEM work request form (DIETRICH T4N-R64W-S7 L01\_FINAL PACKET, p 3) requests that tanks #1, #4, and #7 be disconnected from the fill header to be used as headspace tanks. There is no confirmation in the job sheet (DIETRICH T4N-R64W-S7 L01\_FINAL PACKET, P 22) that this action was completed. Noble's response to the data request from 8/14/2018 stated "Field verification for this facility was completed on or around 3/30/16, field verification confirmed that three tanks were converted into headspace tanks (i.e. removed from liquid service but remained connected to vapor header)."

The STEM Engineering evaluation was completed with 4 tanks at 51% full. The data provided indicates there are 7 tanks on site. Therefore, the model should have been run with 7 tanks at 51% full instead of 4 tanks at 51% full. Running the model with 4 tanks at 51% filled caused an underestimation of both PPIVF and headspace capacity. The modeling guideline was not strictly followed but the engineering design guideline is still considered strictly followed.

This site was selected for IR camera inspection because the video pans over the VCS line too quickly to inspect for leaks.

**Audit Notes**

The stem work request form (PG 3 of Final Packet pdf) states for the pneumatic pshh to set the hp hi/lo no higher than 175 psig however nowhere in the job sheets (PGs 20-23) does it confirm this task was completed. The signed eval and stem engineering design form show the pressure to be set at 155 psig which is in line with "no greater than 175psig" however again, nowhere in the job sheets does it state that any pressure was set. Need to confirm the pneumatic pshh was set as requested in the work request

Noble provided a response to the above discrepancy on 11/14/2018 that states "Rework was completed on or around 8/12/2016, which decreased the HP separator pressure to no higher than 155 psig." Documentation of completed rework was also submitted for verification

Consent Decree Tank System Number: **575**

**Audit Notes**

It is unknown whether the Modeling Guidance was correctly applied with unconfirmed water or oil valve body size. The field data indicates the oil and water valves on the existing separators are 2" bodied valves. There is no indication in the Job Sheet that the valve bodies were modified; Job Sheet only indicates the trims were reduced to 1/2" per the work request.

An oil storage tank was removed from production services as part of the truck vent capture work requested 8/17/16. The Engineering Evaluation did not account for this tank in vapor space service. Audit evaluation was completed with 3 oil tanks and 2 water tanks in production service and 1 tank in vapor space service.

**Audit Notes**

Increasing the KO to burner line from 2" to 4" could NOT be confirmed in the documentation. FDS indicate the size of the line from the KO to the burner is 2". There is no verification 4" line installed from KO to burner as requested on the work request. The signed evaluation indicates this line size is 4". On 12/10/18 Noble responded to a data request "Field verification on 8/18/15 confirmed the installation of a 4" line from KO to burner."

Surge Vessels: Final Packet shows no headspace tanks to be used; Signed Eval pp 2 shows 1 headspace tank. STEM Eng Evaluation Rev 1 shows 1 headspace tank in design. On 12/10/18 Noble responded to a data request with a file named "230\_DILLARD USX T7N-R64W-S5 L01 & DILLARD USX T7N-R64W-S9 L02 TLO Final Packet." The file confirmed that one tank was disconnected from fill header for headspace use. 4 oil tanks remain on site.

LOD ID: **DINNEL T4N-R64W-S26 L02**

Consent Decree Tank System Number: **492**

**Audit Notes**

The NEI Engineering Evaluation was completed with a 3" line from the Tanks to KO drum. The field data sheet indicated the line on the top of the tanks to the KO drum was a 2" line. The work request does not indicate this is to be modified, nor does the job sheet indicate this segment of piping was modified. The Engineering Design Standard has not been strictly applied.

**Audit Notes**

The stem work request form (PG 3 of Final Packet pdf) states to set pneumatic pshh HP Hi/Lo no higher than 120 psig; however, nowhere in the job sheets (PGs 19-23 of the Final Packet) does it confirm this task was completed.

Noble provided a response to the above discrepancy on 11/14/2018 that states "The 'STEM Work Request Form' (Final Packet - page 3), 'STEM Design Confirmation Form' (Final Packet - page 5), the signed 'Vapor Control System Engineering Evaluation' (Signed Eval - page 1), the signed 'Vapor Control System Engineering Evaluation' (Final Signed STEM Plan - page 16), and 'One Pager' (laminated and posted on location) provide consistent documentation that the maximum separator operating pressure was set to no higher than 120 psig as requested. Signature on the Final Packet ensures work was executed per the 'STEM Work Request Form.' "

**Engineering Evaluation Verification Audit**  
Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **DINNER T6N-R65W-S14 L03**

Consent Decree Tank System Number: **1725**

**Audit Notes**

**1. Additional tanks onsite**

Aerial Photos, pg 10 of Final Packet, as well as provided IR camera video show additional tanks onsite which are not referenced in the Signed Eval. It is assumed these tanks have a separate vapor control system and not within the scope of the Dinner T6N-R64W-S14 L03 review.

**2. PPIVFR overestimated**

Modeling Guideline overestimates PPIVFR. Separator maximum pressure of 70 psig used in the Signed Eval, while QC Stem Checkout, pg 25 of Final Packet, indicates actual set point of 65 psig. Overly conservative estimate, not a deficiency of the modeling guideline.

**3. VCS capacity underestimated**

Engineering Design underestimates VCS capacity. Field datasheet, pg 16 of Final Packet, indicates 3" VOC line from header to burner, while Signed Eval used 2" diameter VOC line. Overly conservative estimate, not a deficiency of the engineering design standard.

**4. Oil dump valve size could not be verified**

Job Sheet, pg 27 of Final Packet, confirms a D-Grade 270# LP separator was installed onsite and the oil dump trim size is 1/2". No documentation is provided to show what size dump valve was installed on the separator. A 1" valve size was used in STEM Engineering Evaluation. It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

**5. Field Datasheets are not dated**

The Field Datasheets (Final Packet pg 12-17) are not dated. Assumed the date is the same as Facility Scouting date (4/18/16).

**6. Inconsistencies with Walkdown Checklist, pg 7 of Final Packet**

Item C13 of the Walkdown Checklist, pg 7 of Final Packet, indicates the tank fill lines are configured to enable the LP separator to produce into all tanks. Two (2) oil tanks are onsite, one of which was "bottomed out" for use as a headspace tank according to the Job Sheet, pg 27 of Final Packet. The walkdown checklist was therefore not used as verification of site modifications.

### Audit Notes

Job Sheet (DOVE DURYEA SARCHET T3N-R65W-S22 L01\_FINAL PACKET p 43) indicates that previous underground VOC line was abandoned but does not indicate installation of new line or new line diameter. An above ground line is visible connecting to the combustor in the IR video footage. Noble responded to a data request on 2/20/2018 stating "The 'STEM Work Request Form' (Final Packet - page 3), 'STEM Design Confirmation Form' (Final Packet - page 9), the signed 'Vapor Control System Engineering Evaluation' (Signed Eval - page 2), and the signed 'Vapor Control System Engineering Evaluation' (Final Signed STEM Plan - page 17) provide consistent documentation that the above ground 4" vapor line for tank vapors was installed as requested. Signature on the Final Packet ensures work was executed per the 'STEM Work Request Form.'" This serves as confirmation that the above ground line is 4" in diameter.

LP separator oil leg dump valve size not specified. Assuming largest Kimray valve available with 1/2" trim specified in Engineering Evaluation (DOVE DURYEA SARCHET T3N-R65W-S22 L01\_SIGNED EVAL). It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

**Audit Notes**

The walkdown checklist (DPG BIRD FARM T5N-R65W-S1 L02\_WALKDOWN) was not marked as complete. Completion was verified through other documentation in the final packet (DPG BIRD FARM T5N-R65W-S1 L02\_FINAL PACKET).

The jobsheet noted that they "Tied 4" AGL in to Existing Tornado burner." This was not in the work request. The 4" line is larger than the 3" in the signed eval so this still meets the Engineering Design Standard.

LOD ID: **DR JOE T4N-R63W-S6 L01**

Consent Decree Tank System Number: **1332**

**Audit Notes**

The walkdown checklist (DR JOE T4N-R63W-S6 L01\_WALKDOWN) was not marked as complete. Completion was verified through other documentation in the final packet (DR JOE T4N-R63W-S6 L01\_FINAL PACKET)

The separator pneumatic PSHH is set by the operator not automation and therefore no QA/QC checklist was provided to confirm the maximum pressure of the separator. The STEM One-Pager states that the separator cannot operate above 120 psig and was posted on location via item A14 of the Walkdown Checklist. This serves as confirmation of administrative controls in place to keep the separator below the maximum pressure used in the Engineering Evaluation.

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Noble did not claim any headspace surge capacity in the signed evaluation so the Engineering Design Standard was still applied correctly.

**Engineering Evaluation Verification Audit**  
Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **DR PETERSON T5N-R64W-S10 L01**

Consent Decree Tank System Number: **1071**

**Audit Notes**

The walkdown checklist (DR PETERSON T5N-R64W-S10 L01\_WALKDOWN) was not marked as being complete. Completion was verified through other documentation in the final packet (DR PETERSON T5N-R64W-S10 L01\_FINAL PACKET).

The STEM work request form (DR PETERSON T5N-R64W-S10 L01\_FINAL PACKET, p 3) requests that the LP pressure switch be set to 65 psig. An email from the final packet (DR PETERSON T5N-R64W-S10 L01\_FINAL PACKET, p 24) and the QC Stem checkout form (DR PETERSON T5N-R64W-S10 L01\_FINAL PACKET, p 25) confirm the LP pressure switch was set at 65 psig. The signed evaluation (DR PETERSON T5N-R64W-S10 L01\_SIGNED EVAL) was run with the LP pressure at 55 psig. The data request response (216\_DR PETERSON T5N-R64W-S10 L01\_REWORK) confirmed the PSHH was set to 55 psig on 10/7/2015.

The STEM work request form (DR PETERSON T5N-R64W-S10 L01\_FINAL PACKET, p 3) requests that a new LP Separator be installed on the site. The job sheet (DR PETERSON T5N-R64W-S10 L01\_FINAL PACKET, p 19) confirmed the installation of a new B grade 300# LP surge vessel. A1 of the walkdown checklist (DR PETERSON T5N-R64W-S10 L01\_WALKDOWN, p 1) confirms the 1/2" trim, however there is no confirmation of the valve size. Therefore a 2" valve was used in the model to be conservative. It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

The tank system consists of a single oil tank. The signed evaluation (DR PETERSON T5N-R64W-S10 L01\_SIGNED EVAL) states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

Consent Decree Tank System Number: **597**

**Audit Notes**

It is unknown whether the Modeling Guidance was correctly applied with unconfirmed water valve body sizes. The initial Field Data indicates all water valve bodies are 2". The Evaluation was completed with 1" valve bodies with 1/2" trims. Modification to the trim size was verified per the Job Sheet.

LOD ID: **ECKAS MILLAGE T4N-R64W-S15 L01**

Consent Decree Tank System Number: **640**

**Audit Notes**

The walkdown checklist (ECKAS MILLAGE T4N-R64W-S15 L01\_WALKDOWN) was not marked as being complete. Completion was verified through other supplied documentation in the final packet (ECKAS MILLAGE T4N-R64W-S15 L01\_FINAL PACKET).

The Removed equipment document (ECKAS MILLAGE T4N-R64W-S15 L01\_FINAL PACKET, p 20) confirms that both separators were removed from the site and a new Leed 300 was installed. A1 from the walkdown checklist (ECKAS MILLAGE T4N-R64W-S15 L01\_WALKDOWN), p 2) confirms the signed evaluation (ECKAS MILLAGE T4N-R64W-S15 L01\_SIGNED EVAL) has the correct trim size listed. A 2" valve was used in the model to be conservative. It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

The separator pneumatic PSHH is set by the operator not automation and therefore no QA/QC checklist was provided to confirm the maximum pressure of the separator. The STEM One-Pager states that the separator cannot operate above 120 psig and was posted on location via item A14 of the Walkdown Checklist. This serves as confirmation of administrative controls in place to keep the separator below the maximum pressure used in the Engineering Evaluation.

This site was selected to be an alternate for IR camera inspection because the original video pans over the VCS from the KO to the burner too quickly to visually inspect for leaks.

**Consent Decree Tank System Number:** 233

**Audit Notes**

The walkdown checklist (EHR LCH ST T5N-R65W-S36 L01\_WALKDOWN) was not marked as complete. Completion was verified through other documentation in the final packet (EHR LCH ST T5N-R65W-S36 L01\_FINAL PACKET).

The STEM work request (EHR LCH ST T5N-R65W-S36 L01\_FINAL PACKET, p 3) requests the existing 212 dump valves be replaced with 1" 1400 with 1/2" trim on HLP sep #5. The Walkdown Checklist (EHR LCH ST T5N-R65W-S36 L01\_WALKDOWN) A1 confirms the trim was updated to 1/2". The Job sheet (EHR LCH ST T5N-R65W-S36 L01\_FINAL PACKET, p 21) does not mention that the valve size in the HLP was updated to 1" from 2". The model was run with a 2" valve size to be conservative.

This site was selected for IR camera inspection because the video was taken on a cloudy day and the video was taken with the tops of the tanks in front of the clouds, making it difficult to look for leaks.

LOD ID: **EHRlich GREENHEAD T4N-R66W-S18 L01**

Consent Decree Tank System Number: **2166**

**Audit Notes**

**1. Field Datasheets**

The Field Datasheets (Final Packet, pg 22-29) are not dated. Assumed the date is the same as Facility Scouting date (7/8/2016).

**2. Facility walkdown checklist inconsistencies**

Item C6 and C8 of the Walkdown Checklist (Final Packet, pg 15) are marked "yes" (line drawn from top check box through all boxes below) which references multiple HP and LP oil dumps and the installation of corresponding check valves. The facility has a single HLP separator installed and these items are expected to be marked as "N/A".

Given these inconsistencies, the Walkdown Checklist has not been used as confirmation of changes on site.

**3. Oil dump valve trim size unknown - Request additional information from Noble**

The STEM Work Request (Final Packet, pg 3) requests the LP oil dump be confirmed at 1/2" trim. The only documentation which indicates the oil dump trim size is correct is item A1 on the STEM Walkdown Checklist (Final Packet, pg 11) is checked "yes", however, due to the inconsistencies noted above the checklist is not being used for verification purposes. No other information observed to verify dump valve trim size.

Additionally, no verification of the LP dump valve size was observed for the newly installed HLP separator. The engineering evaluation was run using a 1" valve while the standard LP gas header HLP design P&ID (Final Packet, pg 7) shows a 2" oil dump valve.

***Request additional data from Noble to confirm the oil dump valve and trim size onsite.***

## Engineering Evaluation Verification Audit

Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **EHRlich T4N-R67W-S13 L01**

Consent Decree Tank System Number: **1715**

### Audit Notes

A new HLP separator was brought on-site to replace a HP separator. Could not verify the oil dump valve size (2" or 1") of the new HLP separator. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim. It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: EIFERT VANNOY T6N-R65W-S11 L01

Consent Decree Tank System Number: 66

**Audit Notes**

The Field Data Sheets in the Final Packet do not indicate the valve trim sizes for oil dump valve on 11-65HN HP separator, nor are the water dump valve trim sizes indicated for the 11-63HN HP, 11-65 HN HP, 11-65 HN LP separators. The walkdown checklist is marked NA for both points A1 and A2. No confirmation within the provided documentation that the valve trim sizes for these valves are correct.

NEI completed a field verification on or around 10/10/2018, 11-63 & 11-65 HP and LP separators were confirmed to have 2" valves with 1" trim for both oil and water.

The Engineering Evaluation did not include breathing losses from the non-production accepting tank bank. The facility configuration has two banks - one bank with four (4) oil tanks, one (1) water tank and one (1) TLO tank (separated via check valve), and another bank with three (3) oil tanks, one (1) water tank and one (1) TLO tank (separated via check valve). By excluding the breathing losses from the non-production accepting bank which continues to store oil, the correct application of the Modeling Guidelines cannot be verified.

**Audit Notes**

**1. Field Datasheets**

The Field Datasheets (Final Packet, pg 21-27) are not dated. Assumed the date is the same as Facility Scouting date (1/6/2016).

**2. Facility walkdown checklist inconsistencies**

Item C13 of the Walkdown Checklist (Final Packet, pg 11) is checked "yes", indicating all tank fill lines are configured to enable the LP Separator to produce into all tanks. One oil tank onsite was converted to vapor headspace tank, see Job Sheet (Final Packet, pg 35), therefore it is not possible for the LP Separator to produce into all tanks onsite.

Item C8 of the Walkdown Checklist is checked "yes" in response to multiple LP oil dumps. Only a single LP separator is onsite and the item would be expected to be marked "N/A"

Given these inconsistencies, the Walkdown Checklist has not been used as confirmation of changes on site.

LOD ID: **ERICKSON T6N-R64W-S4 LO1**

Consent Decree Tank System Number: **1005**

**Audit Notes**

The single oil tank fill level was certified to 90% with equalizer height as the control method. A single tank is unable to limit fill level via equalizer height and must utilize other means (level switch with production shutdown, etc.) for tank level control. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

LOD ID: **ERICKSON T6N-R64W-S8 L01**

Consent Decree Tank System Number: **607**

**Audit Notes**

**1. Field Datasheets are not dated**

The Field Datasheets (Final Packet, pg 11-16) are not dated. Date assumed to be same as Facility Scouting Date (9/9/2015).

**2. Diameter of Tanks to Knockout (KO) Pot VOC line - Request additional data**

The Engineering Evaluation shows (1) 3" VOC line from tanks to KO used in the Evaluation and the Field Datasheet (Final Packet, pg 12) shows a 2" VOC line from tanks to KO existed onsite previously.

No documentation is provided to indicate a 3" tank to KO VOC line size was installed onsite. If a 2" VOC line does still exist onsite and not a 3", then the control system capacity is being overestimated and the Engineering Design Standard is not being followed.

**Request confirmation of 3" tank to KO VOC line size onsite.**

**UPDATE 11-26-2018 - Noble confirmed via data request the Tanks to KO VOC line is 3" in diameter. The Engineering Design Standard is being followed**

**Audit Notes**

A Work Order request was issued to "bottom out" one oil tank; remove the oil fill line from the tank while keeping the tank connected to the VCS in order to be utilized as head space only. The accompanying Job Sheet did not confirm the tank was "bottomed out" and the Walkdown Checklist was not checked as complete to "Confirm all the items on the work request form have been completed." Additionally, the provided STEM Retrofit Walkdown Checklist, Item C13, indicates all tank fill lines are configured to enable LP separators to produce into all tanks.

Noble provided verbal confirmation that one oil tank was bottomed out on 8/25/2020.

Consent Decree Tank System Number: **942**

**Audit Notes**

The walkdown checklist (FARR T4N-R64W-S18 L01\_WALKDOWN) was not marked as being complete. Completion was verified through other documentation in the final packet (FARR T4N-R64W-S18 L01\_FINAL PACKET).

The STEM work request (FARR T4N-R64W-S18 L01\_FINAL PACKET, p 12), p 3) requests the 2" VOC line from tanks to KO be upgraded from 2" to 3". The field data sheet (FARR T4N-R64W-S18 L01\_FINAL PACKET, p 12) indicates the VOC line from tanks to KO was 2" The job sheet does not mention upgrading the pipe diameter to 3", as it is in the signed evaluation (FARR T4N-R64W-S18 L01\_SIGNED EVAL, p 2). The data request response from Noble on 11/14/2018 confirms the VOC line was upgraded from 2" to 3".

This site was selected to be re-filmed because the shot looking at the thief hatch was shot looking in to a bright sky. It looked like the PRV was leaking in the DUMP video. Would like to re-film site to confirm.

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

**Audit Notes**

**Oil Dump Valve Size - Unknown**

Jobsheet (Final Packet, pg 22) indicates a new separator was installed onsite and ITEM A1 of the STEM Walkdown Checklist (Final Packet, pg 28) is checked "yes" indicating the oil dump trim is consistent with the Engineering Evaluation, and is therefore 1/2". There is no documentation indicating the oil dump valve size installed in the separator onsite.

A 1" oil dump valve is used in the Engineering Evaluation, no documentation is provided to confirm this valve was/is installed on the LP separator. For the given trim size, 1/2", a 2" valve could be installed and therefore the Modeling Guideline cannot be confirmed as being strictly applied. Assuming a 2" valve size on the separator, the modeled results do not show an exceedance of the vapor control system capacity.

**Audit Notes**

NEI Evaluation was completed with one of the two tanks out of service as additional headspace. The job sheet indicates the tank was disabled from receiving liquids while remaining connected to the VCS, but the walkdown checklist indicates all tanks are capable of receiving liquid production. Need verification whether tank is vapor service only or capable of receiving production liquids.

NEI response to follow data request regarding headspace tank provided below. Data received 8/14/2018: "Field verification for this facility was completed on or around 5/1/17, field verification confirmed that one tank was converted into a headspace tank (i.e. removed from liquid service but remained connected to vapor header)."

Documentation indicates that a 1" flow orifice is used in combination with a valve to restrict flow from the LP separator. NEI provided a summary of their derivation of combined flow valve-orifice flow characteristics. SLR used Cf and Cv as provided by NEI.

Engineering Evaluation (FED T8N-R59W-S8 L01\_SIGNED EVAL) run at 145 psi upstream of the oil dump. The Field Datasheet (FED T8N-R59W-S8 L01\_FINAL PACKET, p 13) indicates that there is a PSV on the LP separator set at 75 psi, which limits dump valve pressure. SLR completed its audit calculations at 145 to match the Engineering Evaluation since this is more conservative.

**Audit Notes**

The separator pneumatic PSHH is set by the operator, not automation, and therefore no QA/QC checklist was provided to confirm the maximum pressure of the separator. The STEM One-Pager states that the separator cannot operate above 140 psig and was posted on location via Walkdown Checklist Item A14. This serves as confirmation of administrative controls in place to keep the separator below the maximum pressure used in the Engineering Evaluation.

**Audit Notes**

**1. Field Datasheets are not dated**

The Field Datasheets (Final Packet, pg 11-16) are not dated. Date assumed to be same as Facility Scouting Date (8/03/2016).

**2. Vapor Surge Vessel**

A Work Order request was issued to "bottom out" one oil tank; remove the oil fill line from the tank while keeping the tank connected to the VCS in order to be utilized as head space only. The accompanying Job Sheet did (did not) confirm a tank was "bottomed out" and the Walkdown Checklist was not checked as complete to "Confirm all the items on the work request form have been completed." Additionally, the STEM Retrofit Walkdown Checklist, Item C13, was checked "yes" indicating all tank fill lines are configured to enable separator to produce into all tanks. Additional information was not provided to clarify the inconsistent and conflicting information, thus it is unknown whether the Engineering Design Standard for properly applied.

**Request confirmation from Noble that one tank was bottomed out (isolated from liquid service and used as headspace only tank).**

**UPDATE 11/26/2018 - Noble confirmed via data request one oil tank was bottomed and converted to a vapor surge vessel on this site. The Engineering Design Standard has been properly applied.**

**Audit Notes**

The Walkdown checklist (FERGUSON T5N-R64W-S23 L02\_WALKDOWN) was not verified as being complete. Completion was verified through other documentation in the final packet (FERGUSON T5N-R64W-S23 L02\_FINAL PACKET).

The field datasheet (FERGUSON T5N-R64W-S23 L02\_FINAL PACKET) lists the HP separator as having a 2" valve and a 1" trim. The job sheet (FERGUSON T5N-R64W-S23 L02\_FINAL PACKET, p 19) confirms the trim was updated to 1/2", but there is no mention of reducing the valve size to 1". Therefore, the model was run with a 2" valve to be conservative. It is unknown in this case if the modeling guideline was strictly followed.

This site was selected for further IR Camera inspection because the camera is very shaky and the video was filmed looking into the clouds.

Consent Decree Tank System Number: **190**

**Audit Notes**

The STEM Work Request (Final Packet, pg 3) requests LP separator to shut-in at 70 psig. The Engineering Evaluation (Signed Eval) shows a 70 psig max separator pressure was used in the Evaluation. The Job Sheet (Final Packet, pg 23) states the LP separators were set to shut-in at 60 psig and the QC Stem Checkout form (Final Packet, pg 22) states it was set at 70 psig. A 70 psig LP separator shut-in pressure was used in SLR's evaluation.

The PRVs are not visible in the provided IR videos.

**Consent Decree Tank System Number:** 58

**Audit Notes**

The walkdown checklist (FIVE RIVERS T4N-R66W-S4 L01\_WALKDOWN) was not marked as complete. Completion was verified through other documentation in the final packet (FIVE RIVERS T4N-R66W-S4 L01\_FINAL PACKET).

This site was selected to be re-filmed with an IR camera because the pipes were quickly panned over and no joints were inspected.

## Engineering Evaluation Verification Audit

Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **FOEMEYER FOE T5N-R64W-S2 L01**

Consent Decree Tank System Number: **288**

### Audit Notes

Walkdown not marked complete

There is a discrepancy in regards to the water dump valve trim size on the LP. The field sheets (PG 13 of PDF) show the valve trim size to have been 1/2" however the stem design confirmation form (PG 5 of PDF) shows the valve trim size to be 1". The work request nor the job sheets confirm this work was completed, going from 1/2" trim to 1" trim on the LP water dump, however this is how the site was modeled.

**Audit Notes**

The stem work request form (PG 3 of Final Packet pdf) states to install fisher 4660 and versa valve set to shut in HLP HP hi/lo if HLP LP reaches 70 psig; however, nowhere in the job sheets (PGs 18-21 of the Final Packet) does it confirm this task was completed.

Noble provided a response to the above discrepancy on 11/14/2018 that states "The 'STEM Work Request Form' (Final Packet - page 3), 'STEM Design Confirmation Form' (Final Packet - page 5), the signed 'Vapor Control System Engineering Evaluation' (Signed Eval - page 1), the signed 'Vapor Control System Engineering Evaluation' (Final Signed STEM Plan - page 16), and 'One Pager' (laminated and posted on location) provide consistent documentation that the maximum separator operating pressure was set to no higher than 70 psig as requested. Signature on the Final Packet ensures work was executed per the 'STEM Work Request Form.' "

LOD ID: **FOOSE T6N-R64W-S18 L02**

Consent Decree Tank System Number: **602**

**Audit Notes**

The walkdown checklist (FOOSE T6N-R64W-S18 L02\_WALKDOWN) was not marked as complete. Completion was verified through other documentation in the final packet (FOOSE T6N-R64W-S18 L02\_FINAL PACKET).

The STEM work request document (FOOSE T6N-R64W-S18 L02\_FINAL PACKET, p 3) requests the existing 2" VOC line from the tanks to the KO be replaced with a 3" diameter line. The Job sheet (FOOSE T6N-R64W-S18 L02\_FINAL PACKET, p 23) does not confirm this. The STEM line abandonments form (FOOSE T6N-R64W-S18 L02\_FINAL PACKET, p 27) only confirms the 2" line from the KO to the burners was replaced. The data request from 11/14/2018 confirmed the line was upgraded from 2" to 3."

The STEM work request form (FOOSE T6N-R64W-S18 L02\_FINAL PACKET, p 3) requests that separator 2 have a 2" valve with a 3/4" trim installed. The job sheet (FOOSE T6N-R64W-S18 L02\_FINAL PACKET, p 23) does not confirm this. A1 of the walkdown checklist (FOOSE T6N-R64W-S18 L02\_WALKDOWN) confirms the signed eval (FOOSE T6N-R64W-S18 L02\_SIGNED EVAL) has the correct trim size. Only a 2" valve is able to have a 3/4" trim.

The STEM work request form (FOOSE T6N-R64W-S18 L02\_FINAL PACKET, p 3) requests that the 12 oz. thief hatch on oil tank #2 be upgraded to 16 oz. The job sheet form (FOOSE T6N-R64W-S18 L02\_FINAL PACKET, p 3) does not confirm upgrading these. However, the walkdown checklist confirms the thief hatches and PRV's are all at 16 oz.

LOD ID: **FOSS T6N-R63W-S6 L02**

Consent Decree Tank System Number: **1824**

**Audit Notes**

The walkdown checklist (FOSS T6N-R63W-S6 L02\_WALKDOWN) was not checked as being complete. Completion was verified through other documentation in the final packet (FOSS T6N-R63W-S6 L02\_FINAL PACKET)

The LP separator was modeled in the signed evaluation with a 1" valve with 1/2 trim. The walkdown checklist (FOSS T6N-R63W-S6 L02\_WALKDOWN, p 1) item A1 confirms the trim sizes (1/2") on the signed eval (FOSS T6N-R63W-S6 L02\_SIGNED EVAL, p 2) are correct. There was no confirmation that the valve size was changed from the original 2" size. A 2" valve was used in these calculations to be conservative. It is unknown if the modeling guideline was strictly followed for the tank system.

**Audit Notes**

There is conflicting data regarding the separators on site. The work request states to remove unused separator 3 (SN 1752) from site however the job sheets do not confirm this task was completed. Also in the job sheets it states a new d grade separator was installed (SN 70699) associated with all the wells on site however it cannot be inferred if it is a LP or HP

Noble provided a response to the above discrepancy on 11/14/2018 that states "Field verification for this facility was completed on or around 6/1/2017, field verification confirmed that the original separator remains in use (confirmed by serial number listed in the facility walkdown). An engineering review of this facility was completed on or around 9/17/2018, this review confirmed the material transfer form in the final packet is incorrect in saying a new d-grade separator was installed."

LOD ID: **FRANK T4N-R63W-S7 L01**

Consent Decree Tank System Number: **450**

**Audit Notes**

The walkdown checklist (FRANK T4N-R63W-S7 L01\_WALKDOWN) was not marked as complete. Completion was verified through other documentation in the final packet (FRANK T4N-R63W-S7 L01\_FINAL PACKET).

A Work Order (FRANK T4N-R63W-S7 L01\_FINAL PACKET, p 3) request was issued to "bottom out" east-most oil tank; remove the oil fill line from the tank while keeping the tank connected to the VCS in order to be utilized as head space only. The accompanying Job Sheet did not confirm the tank was bottomed out. Additionally, the provided STEM Retrofit Walkdown Checklist (FRANK T4N-R63W-S7 L01\_WALKDOWN, p3), Item C13, was checked "N/A". The data request response provided 11/14/2018 confirmed that one tank was converted to a headspace tank.

The separator pneumatic PSHH is set by the operator not automation and therefore no QA/QC checklist was provided to confirm the maximum pressure of the separator. The STEM One-Pager states that the separator cannot operate above 140 psig and was posted on location via item A14 of the Walkdown Checklist. This serves as confirmation of administrative controls in place to keep the separator below the maximum pressure used in the Engineering Evaluation.

LOD ID: **FRANK T4N-R64W-S12 L02**

Consent Decree Tank System Number: **744**

**Audit Notes**

The walkdown checklist (FRANK T4N-R64W-S12 L02\_WALKDOWN) was not marked as being complete. Completion was verified through other documentation in the final packet (FRANK T4N-R64W-S12 L02\_FINAL PACKET).

The STEM Request form (FRANK T4N-R64W-S12 L02\_FINAL PACKET, p 3) requests that the existing separator on site be replaced with a new separator. A1 from the walkdown checklist (FRANK T4N-R64W-S12 L02\_WALKDOWN, p 1) confirms that the trim size in the signed evaluation (FRANK T4N-R64W-S12 L02\_SIGNED EVAL, p 2) is correct. There is no mention of the new separator's valve size, so a 2" valve was used to be conservative. It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

The separator pneumatic PSHH is set by the operator not automation and therefore no QA/QC checklist was provided to confirm the maximum pressure of the separator. The STEM One-Pager states that the separator cannot operate above 115 psig and was posted on location via item A14 of the Walkdown Checklist. This serves as confirmation of administrative controls in place to keep the separator below the maximum pressure used in the Engineering Evaluation.

LOD ID: **FRENCH HAMMERBECK T6N-R64W-S33 L01**

Consent Decree Tank System Number: **2132**

**Audit Notes**

The walkdown checklist (FRENCH HAMMERBECK T6N-R64W-S33 L01\_WALKDOWN) was not marked as being complete. Completion was verified with other documentation in the final packet (FRENCH HAMMERBECK T6N-R64W-S33 L01\_FINAL PACKET).

This site was selected for additional IR filming because the whole facility was panned over very quickly. No video was longer than 65 seconds.

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

Consent Decree Tank System Number: **312**

**Audit Notes**

The STEM Engineering Evaluation was modeled with a 2" valve w/. 1/2" trim, however the work request (FINAL PACKET p 3-4) states that the valve should be replaced with a 1" w/. 1/2" trim. The job sheet (FINAL PACKET p. 23) confirms that the valve installed was a 1" w/. 1/2" trim. The modeling guideline was still strictly followed because the engineering evaluation calculated a higher PPIVF than the actual valve on site

This site has been selected for IR camera inspection due to high line pressure.

LOD ID: **FRICK T4N-R64W-S18 L01**

Consent Decree Tank System Number: **625**

**Audit Notes**

The walkdown checklist (FRICK T4N-R64W-S18 L01\_WALKDOWN) is not marked as being complete. Completion was verified through other documentation in the final packet (FRICK T4N-R64W-S18 L01\_FINAL PACKET).

This site was selected to be re-filmed because the PRV's were not shown well in any of the 3 videos.

The STEM work request document (FRICK T4N-R64W-S18 L01\_FINAL PACKET, p 3) requests that all existing 14 oz. Wellmark PRV's be replaced with 16 oz. Morrison PRVs. The Job sheet ((RICK T4N-R64W-S18 L01\_FINAL PACKET, p 39) does not mention upgrading the thief hatches. The walkdown checklist (FRICK T4N-R64W-S18 L01\_WALKDOWN) confirms the thief hatches are all 16 oz.

The STEM work request document (FRICK T4N-R64W-S18 L01\_FINAL PACKET, p 3) requests that the existing 212 dump valve be replaced with a 1" 1400 with 1/2" trim. The walkdown checklist item A1 confirms the valve trim was changed but the valve size could not be confirmed. the largest valve size with a 1/2" trim was used in these calculations to be conservative.

**Audit Notes**

A new HLP separator was installed in place of the double glycol unit. There is no information indicating whether the dump valve with the glycol unit was then installed with the new HLP unit. For purposes of this evaluation, it is assumed the existing valve was installed with the new HLP separator.

**Audit Notes**

**1. Unable to confirm separator oil dump valve size - Request additional data**

The Job Sheets (Final Packet pg 32 & 34) indicate a new HLP Separator was installed onsite. Item A1 of the Walkdown Checklist (Final Packet pg 38) indicates the correct trim size (1/2") is installed on the HLP Separator, however, documentation is not provided indicating the size of the oil dump valve.

The "Standard Design 125# HLP Design" separator P&ID (Final Packet pg 9) indicates 2" dump valve size. The Final Design Packet was run with a 1" valve size (see Audit pg 2 of this audit packet), which would underestimate PPIVFR. It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

**2. Field Datasheets are not dated**

The Field Datasheets (Final Packet pg 13-20) are not dated. Assumed the date is the same as Facility Scouting date (9/2/16).

Consent Decree Tank System Number: **577**

**Audit Notes**

The VOC line size from the tanks to the knockout is listed on the field sheet as "2-5." It is unknown if this refers to the combustor number on the field sheet or the size of the voc line. Noble confirmed in an email date 8/26/2020 that field verified that the VOC line size from the tanks to the Knockout is 3 inches.

The separator pneumatic PSHH is set by the operator, not automation, and therefore no QA/QC checklist was provided to confirm the maximum pressure of the separator. The STEM One-Pager states that the separator cannot operate above 60 psig and was posted on location via Walkdown Checklist Item A14. This serves as confirmation of administrative controls in place to keep the separator below the maximum pressure used in the Engineering Evaluation.

The model of Cimarron combustors used were not provided however based on the IR camera footage they appear to be 48HV.

The field data indicated the oil and water dump valves are 2 inch valves with 1/2 inch trims. The signed evaluation was completed with 1 inch valves which results in a lower PPIVFR than a 2 inch valve. As a result the modeling guideline has not been applied correctly.

**Audit Notes**

The work request form indicates a 4" AGL is to be installed from the KO pot to the burner. There is no documentation provided confirming the line modification was completed. IR videos show an AGL from the VOC KO pot to the burner.

The Work Request indicated the LP oil dump valve was to be modified to Kimray 1400 with 1/2 inch trims. Could not verify the oil dump valve size (2" or 1") on the LP separator with the documentation provided. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim.

It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

LOD ID: **GERRITY ST T4N-R65W-S36 L03**

Consent Decree Tank System Number: **690-a**

**Audit Notes**

**Oil Dump Valve Size - Unknown**

Field Datasheets (Final Packet, pg 8) indicate the HLP separator onsite originally had 2" oil dump valve with unknown trim size. The STEM Work Request Form (Final Packet, pg 3) requests the oil dump valve trim to be replaced with a 1/2" trim and the Engineering Evaluation shows a 1" oil dump valve with 1/2" trim is currently installed onsite.

ITEM A1 of the STEM Walkdown Checklist (Final Packet, pg 24) is checked "yes" indicating the oil dump trim onsite is consistent with the Engineering Evaluation, and is therefore 1/2". There is no indication the oil dump valve onsite was changed from a 2" valve to a 1" valve.

A 1" oil dump valve is used in the Engineering Evaluation, no documentation is provided to confirm this valve was/is installed on the HLP separator. For the given trim size, 1/2", a 2" valve could be installed and therefore the Modeling Guideline cannot be confirmed as being strictly applied. Assuming a 2" valve size on the separator, the modeled results do not show an exceedance of the vapor control system capacity.

**Single Tank Battery**

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

**Audit Notes**

The stem work request (PG 3 of the Final Packet) states the existing 2" VOC line on the top of the tank was to be replaced with a 3" VOC line down to the KO pot however nowhere in the Job Sheets (PGs 21-25 of the Final Packet) does it confirm this task was completed

Noble provided a response to the above discrepancy on 11/14/2018 that states "Field verification for this facility was completed on or around 4/28/2017, field verification confirmed that the 3" VOC line from the tank to the KO pot was installed."

**Audit Notes**

A new LP separator was brought on-site to develop a HP-LP train. Could not verify the oil dump valve size (2" or 1") of the new LP separator. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim.

It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

The single oil tank fill level was certified to 90% with equalizer height as the control method. A single tank is unable to limit fill level via equalizer height and must utilize other means (level switch with production shutdown, etc.) for tank level control. Zero headspace surge capacity was used in the NEI evaluation.

**Audit Notes**

The signed evaluation states that the PSHH should be set to 140 psig, however there is no verification that this work was completed (FINAL PACKET p. 4-29).

Noble provided a response to the above discrepancy on 11/14/2018 that states "The 'STEM Work Request Form' (Final Packet - page 3), 'STEM Design Confirmation Form' (Final Packet - page 7), the signed 'Vapor Control System Engineering Evaluation' (Signed Eval - page 1), the signed 'Vapor Control System Engineering Evaluation' (Final Signed STEM Plan - page 16), and 'One Pager' (laminated and posted on location) provide consistent documentation that the maximum separator operating pressure was set to no higher than 140 psig as requested. Signature on the Final Packet ensures work was executed per the 'STEM Work Request Form.' "

Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **GRAVEL DRAW T8N-R61W-S30 L01\_WALKDOWN**

Consent Decree Tank System Number: **1969**

**Audit Notes**

The walkdown checklist (GRAVEL DRAW T8N-R61W-S30 L01\_WALKDOWN) was not marked as complete. Completion was verified through other documents in the final packet (GRAVEL DRAW T8N-R61W-S30 L01\_FINAL PACKET).

Documentation indicates that a 1" flow orifice is used in combination with a valve to restrict oil flow from the LP separator. NEI provided a summary of their derivation of combined flow valve-orifice flow characteristics. SLR used Cf and Cv as provided by NEI.

The separator pneumatic PSHH is set by the operator, not automation, and therefore no QA/QC checklist was provided to confirm the maximum pressure of the separator. The STEM One-Pager states that the separator cannot operate above 185 psig and was posted on location via Walkdown Checklist Item A14. This serves as confirmation of administrative controls in place to keep the separator below the maximum pressure used in the Engineering Evaluation.

LOD ID: **GREEN USX EE T7N-R65W-S13 L02**

Consent Decree Tank System Number: **1602**

**Audit Notes**

**1. PPIVFR overestimated**

The Job Sheet (Final Packet pg 22) indicates a 1" valve size was installed onsite. The STEM Engineering Evaluation provided shows a 2" valve was used in the evaluation. Using a 2" valve onsite results in an overestimated PPIVFR and therefore the Modeling Guideline is being met and exceeded.

**2. Field Datasheets are not dated**

The Field Datasheets (Final Packet pg 12-17) are not dated. Assumed the date is the same as Facility Scouting date (4/18/16).

**Audit Notes**

A Work Order request was issued to "bottom out" one oil tank and leave connected to the VCS in order to be utilized as head space only. The accompanying Job Sheet did not confirm the tank was "bottomed out" and the Walkdown Checklist was not checked as complete to "Confirm all the items on the work request form have been completed." Additionally, the provided STEM Retrofit Walkdown Checklist, Item C13, was checked "yes" indicating all tank fill lines are configured to enable LP separators to produce into all tanks.

Noble provided information on 11/14/2018 indicating a "Field verification for this facility was completed on or around 10/4/2016, field verification confirmed that one tank was converted to a headspace tank." The Engineering Design Standard has been appropriately applied based on the provided field verification information.

The NEI Engineer Evaluation was completed with 3" NPS for the Tanks to KO VCS piping, 4" NPS for the KO to Burner VCS piping, and 2" NPS for the Main Header to Burner Inlet VCS piping. Field Datasheets indicate the Tank to KO VCS piping is 2" NPS, KO to Burner VCS piping is 2" NPS BGL (modified to 4" AGL), and the Main Header to Burner Inlet VCS piping is 3" NPS. There is no confirmation that the modification to the Tanks to KO VCS piping was modified to 3".

Noble provided information on 11/14/2018 indicating a "Field verification for this facility was completed on or around 10/4/2016, field verification confirmed that the 3" VOC line from the tank to the KO was installed." The Engineering Design Standard was appropriately applied based on the provided field verification information.

LOD ID: **GUSTAFSON T6N-R65W-S4 L01**

Consent Decree Tank System Number: **1097**

**Audit Notes**

The walkdown checklist (GUSTAFSON T6N-R65W-S4 L01\_WALKDOWN) was not marked as complete. Completion was verified through other documentation in the final packet (GUSTAFSON T6N-R65W-S4 L01\_FINAL PACKET) where applicable.

The work request form (GUSTAFSON T6N-R65W-S4 L01\_FINAL PACKET, p 3) requests a new 300 LP gas header be installed. The job sheet (GUSTAFSON T6N-R65W-S4 L01\_FINAL PACKET, p 23) confirms a new 300 LP separator was installed with a 1/2" trim. There was no mention of the valve size, so a 2" valve was used in the model to be conservative. It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

The work request (GUSTAFSON T6N-R65W-S4 L01\_FINAL PACKET, p 14) states that the PSHH on the LP separator was to be set at 70 psig. An email on 1/26/2016 (GUSTAFSON T6N-R65W-S4 L01\_FINAL PACKET, p 27) confirms the operating pressure was set to 70 psig. A stem rework request dated 3/3/2016 (GUSTAFSON T6N-R65W-S4 L01\_REWORK) requests the PSHH be set to 55 psig. The signed evaluation from 3/16/2016 (GUSTAFSON T6N-R65W-S4 L01\_SIGNED EVAL) lists the maximum operating pressure back as 55 psig. There was no confirmation the rework was completed to reduce the maximum operating pressure of the LP separator from 70 psig to 55 psig. Noble provided additional data on 11/14/2018 stating that "Rework was completed on or around 3/15/2016, which decreased the LP separator pressure to no higher than 55 psig. Automation verification for this facility was completed on or around 3/15/2016, automation verification confirmed that the PSHH setting on the LP Separator was set at no higher than 55 psig."

**Audit Notes**

The Work Request indicated the oil dump valves on Separator was to be modified to Kimray 1400 with 1/2 inch trim. Could not verify the oil dump valve size (2" or 1") with the documentation provided. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim. It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size

**Audit Notes**

**Oil Dump Valve Size - Unknown**

Jobsheet (Final Packet, pg 21) indicates a new HLP separator was installed onsite and ITEM A1 of the STEM Walkdown Checklist (Final Packet, pg 27) is checked "yes" indicating the oil dump trim onsite is consistent with the Engineering Evaluation, and is therefore 1/2". There is no indication provided of the oil dump valve size installed in the HLP separator onsite.

A 1" oil dump valve is used in the Engineering Evaluation, no documentation is provided to confirm this valve was/is installed on the HLP separator. For the given trim size, 1/2", a 2" valve could be installed and therefore the modeling guideline cannot be confirmed as being followed. Assuming a 2" valve size on the separator, the modeled results do not show an exceedance of the vapor control system capacity.

**Audit Notes**

The walkdown checklist (GUTTERSEN ST T4N-R63W-S20 L01\_WALKDOWN) was not marked as being complete. Completion was verified with other documentation from the final packet (GUTTERSEN ST T4N-R63W-S20 L01\_FINAL PACKET).

The Signed eval (GUTTERSEN ST T4N-R63W-S20 L01\_SIGNED EVAL) from 11/30/2017 indicates the max separator pressure is 70 psi. An email from 11/9/2015 confirms this pressure (GUTTERSEN ST T4N-R63W-S20 L01\_FINAL PACKET, p 27) . However, another email from 11/11/2015 verifies the pressure switch is set to 60 psi (GUTTERSEN ST T4N-R63W-S20 L01\_FINAL PACKET, p 27). Using a higher pressure will give a higher PPIVFR, therefore is more conservative, so 70 psig was used in the model.

Consent Decree Tank System Number: **1227**

**Audit Notes**

**Oil Dump Valve Size - Unknown**

The Jobsheet (Final Packet, pg 20) indicates a new HLP separator was installed onsite with an unknown oil dump valve size and trim size. ITEM A1 of the STEM Walkdown Checklist (Final Packet, pg 26) is checked "yes" indicating the oil dump trim size onsite is consistent with the trim size used in the Engineering Evaluation, and is therefore 1/2".

A 1" oil dump valve is used in the Engineering Evaluation, no documentation is provided to confirm this valve was/is installed on the HLP separator. For the given trim size, 1/2", a 2" valve could be installed and therefore the Modeling Guideline cannot be confirmed as being strictly applied. Assuming a 2" valve size on the separator, the modeled results do not show an exceedance of the vapor control system capacity.

**Single Tank Battery**

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

Consent Decree Tank System Number: **548**

**Audit Notes**

The walkdown checklist (GUTTERSEN ST USX T3N-R64W-S21 L01\_WALKDOWN) was not marked as being complete. Completion was verified through other documentation in the final packet (GUTTERSEN ST USX T3N-R64W-S21 L01\_FINAL PACKET).

The STEM work request (GUTTERSEN ST USX T3N-R64W-S21 L01\_FINAL PACKET, p 3) requests that one of the two LEED 48" VOC burners initially on site be disconnected and removed from the VOC header. The job sheet (GUTTERSEN ST USX T3N-R64W-S21 L01\_FINAL PACKET, p 31) does not mention removing any burners. The STEM model was run with only 1 burner (LEED GEN1-#7) to be conservative.

Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **GUTTERSEN T3N-R64W-S33 L02**

Consent Decree Tank System Number: **1327**

**Audit Notes**

The walkdown checklist (GUTTERSEN T3N-R64W-S33 L02\_WALKDOWN) was not marked as complete. Completion was verified with documents in the final packet (GUTTERSEN T3N-R64W-S33 L02\_FINAL PACKET).

The STEM work request form (GUTTERSEN T3N-R64W-S33 L02\_FINAL PACKET, p 3) requested that the existing LEED burner be replaced with a new Cimarron 48HV Burner. The Job Sheet (GUTTERSEN T3N-R64W-S33 L02\_FINAL PACKET, p 25) states a LEED 48" burner was installed. The signed eval also (GUTTERSEN T3N-R64W-S33 L02\_SIGNED EVAL, p 2) states the burner on site is a LEED 48" Gen 1 #7. LEED 48"

The Field datasheet (GUTTERSEN T3N-R64W-S33 L02\_FINAL PACKET, p 12) states the VOC line from the tanks to the knockout is 2". The signed evaluation (GUTTERSEN T3N-R64W-S33 L02\_Signed Eval, p 2) lists the VOC size from tanks to KO as 3". There is no work request or documentation in the job sheet (GUTTERSEN T3N-R64W-S33 L02\_FINAL PACKET, p 24) indicating the 2" line was replaced with a 3" line. There was no mention of changing the VOC line size in the STEM work request form (GUTTERSEN T3N-R64W-S33 L02\_FINAL PACKET, p 3). Noble acknowledged that the line from the tanks to KO was 2" in their 8/14/2018 response to a data request. A new signed evaluation with a 2" line from the tanks to KO was provided. It is dated 7/17/2018.

There is also no confirmation that the 2" underground VOC line (GUTTERSEN T3N-R64W-S33 L02\_FINAL PACKET, p 15) connecting the KO to the burner was replaced with a 4" line. The model (GUTTERSEN T3N-R64W-S33 L02\_STEM Engineering Evaluation\_rev1) agrees with the signed eval pipe diameters. In a 8/14/2018 response to a data request Noble stated that "Field verification for this facility was completed on or around 5/19/2016. Field verification confirmed that the 2" underground line was replaced with a 4" line to the burner."

Per the walkdown checklist (GUTTERSEN T3N-R64W-S33 L02\_WALKDOWN) A1, and the signed eval (GUTTERSEN T3N-R64W-S33 L02\_SIGNED EVAL, p 2) the trim size was confirmed to be 1/2", However, there is no confirmation of valve size. Therefore the largest valve size (2") was used in the model to be conservative. It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

This site was selected for an additional IR camera inspection because the VCS from the tanks to the burner was filmed over too quickly for visual inspection.

LOD ID: **GUTTERSEN USX T3N-R64W-S23 L01**

Consent Decree Tank System Number: **558**

**Audit Notes**

**1. Field Datasheets are not dated**

The Field Datasheets (Final Packet pg 11-16) are not dated. Assumed the date is the same as Facility Scouting date (7/14/2015).

**2. Unable to confirm VOC line size onsite - Request additional data**

STEM Work Request Form (Final Packet pg 3) requests a 4" VOC line be connected to the burner. The STEM Engineering Evaluation indicates a 4" VOC line from KO to burner was used in the calcs. Field Data Notes (Final Packet pg 15) indicate a 2" VOC line from KO to burner existed previously onsite. The Job Sheet (Final Packet pg 19) indicates an above ground line (AGL) was installed, although no indication of the size of the line was observed. If 2" VOC is currently onsite the STEM Engineering Evaluation will be overestimating VCS capacity.

**Request data from Noble to verify VOC line size from KO to burner currently onsite. -**

***Update 8/15/2018 - Noble confirmed a 4" VOC line from KO to burner.***

**3. Unable to confirm oil dump valve size onsite - Request additional data**

The Job Sheet (Final Packet pg 21) indicates both existing separators on site were removed and a new HLP separator was installed. The STEM Work Request (Final Packet pg 3) indicates the LP oil dump was to have a 1" valve with 1/2" trim installed. Item A1 of the the Walkdown Checklist (Final Packet pg 25) indicates the proper oil dump trim size is installed onsite. It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

**4. Tank banking misinterpretation**

The Signed Walkdown (Final Packet pg 28) indicates the tanks on site are banked. However, the included description of "one bank of two oil tanks" is not in line with the definition of "tank banking". Of the two tanks on site, one is a vapor space tank as indicated by item C13 of the walkdown checklist. Therefore tanks are not banked and the site follows the Signed Eval.

Consent Decree Tank System Number: **219**

**Audit Notes**

The STEM Work Request indicated that a GWAA 2-31/32 separator was to be converted to a LP separator. The Job Sheet and Equipment sheets indicate a new LP separator was brought on-site to develop the HP-LP train. Could not verify the oil dump valve size (2" or 1") of the new LP separator. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim.

It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

Site was selected for an IR Camera Inspection because provided IR footage indicated possible emissions release.

Consent Decree Tank System Number: **637**

**Audit Notes**

THE WALKDOWN CHECKLIST WAS NOT MARKED COMPLETE.

The stem work request form (PG 3 of FINAL PACKET pdf) states the 2" VOC line from tank to KO was to be changed to a 3" line however nowhere in the job sheets (PGs 18 through 22 of FINAL PACKET pdf) does it confirm this task was completed.

**NOBLE RESPONSE:**

Field verification for this facility was completed on or around 8/16/2016, field verification confirmed 3" VOC line from the tank to the KO pot was installed.

This site was an alternate site selected for IR Camera Inspection based upon its system pressure group ( $\geq 186$ ,  $< 233$ )

## Engineering Evaluation Verification Audit

Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **HANSCOME HBR T4N-R65W-S11 L01**

Consent Decree Tank System Number: **248**

### Audit Notes

The Work Request indicated the oil dump valve on HLP Separator was to be modified to a 1/2" trim. The Field Data indicated the dump valve was a 2" valve. The Engineering Evaluation was completed with a 1" valve with a 1/2" trim. Could not verify the oil dump valve size (2" or 1") on the separator with the documentation provided. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim.

It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

**Audit Notes**

A Work Order request was issued to "bottom out" one tank; remove the oil fill line from the tank while keeping the tank connected to the VCS in order to be utilized as head space only. The accompanying Job Sheet did confirm the tank was "bottomed out " but the provided STEM Retrofit Walkdown Checklist, Item C13, was checked "yes" indicating all tank fill lines are configured for LP separators to produce into all tanks. Requested confirmation from NEI that a tank was bottomed out to create additional vapor headspace.

The NEI data request response confirmed one tank was bottomed out and an updated signed Engineering Evaluation sheet with only one tank bottomed out for a vapor headspace tank was provided.

**Audit Notes**

-The Walkdown checklist was not marked complete. Modifications were confirmed with other documentation.

-The valve size of the new HLP separator could not be confirmed. The valve trim size was confirmed via the walkdown checklist. The largest valve size with a 1/2" trim was used in these calculations.

This site was selected for IR Camera Inspection based upon the understanding that we could not confirm the modeling guidance was followed

LOD ID: **HARPER T7N-R65W-S34 L01**

Consent Decree Tank System Number: **1717**

**Audit Notes**

A new LP separator was brought on-site to develop a HP-LP train. Could not verify the valve size (2" or 1") of the new LP separator. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim.

It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

**LOD ID:** HARRISON KOCH RAY T4N-R65W-S32 L01

**Consent Decree Tank System Number:** 2360

**Audit Notes**

The Walkdown Checklist (HARRISON KOCH RAY T4N-R65W-S32 L01\_WALKDOWN.pdf, pg. 4) did not indicate if all items on the Work Request form had been completed. Completion of the Work Request was verified through other documentation in the Final Packet.

The Job Sheet (HARRISON KOCH RAY T4N-R65W-S32 L01\_FINAL PACKET.pdf, pg. 23-27) and the QC Stem Checkout (HARRISON KOCH RAY T4N-R65W-S32 L01\_FINAL PACKET.pdf, pg. 22) were used to identify equipment removed and the presence of the LP separator. The oil tank count and size were obtained from the IR camera videos (HARRISON KOCH RAY T4N-R65W-S32 L01\_1185\_NORMAL.mp4) and supplied photo from the data request from 11/30/2018 (028\_HARRISON KOCH RAY T4N-R65W-S32 L01 Crude Oil Tanks (1)). The Job description (HARRISON KOCH RAY T4N-R65W-S32 L01\_FINAL PACKET.pdf, pg. 23) confirms the valve is 1" and the trim was updated to 1/2" as requested.

This site was selected for an additional IR camera inspection because the VCS line was panned over very quickly and it was difficult to inspect for possible leaks.

Consent Decree Tank System Number: **1490**

**Audit Notes**

Emissions were observed emanating from the PRV on top of the tank in both the DUMP and POST-DUMP videos around the 2:05 to 2:10 mark in both videos.

The QC Stem (PG 25 of Final Packet pdf) verifies the pressure of LP to have been set to shut in at 55psig as requested in the work request (PG 3 of final packet pdf) however the signed eval and stem engineering evaluation show site to have been modeled with the pressure set at 70 psig. PPIVFR was overestimated in the signed evaluation therefore the modeling guideline was still strictly applied.

Consent Decree Tank System Number: **479**

**Audit Notes**

The Work Request indicated a replacement of the Kimray 212 dump valve on separator 1 with a 1" 1400 Kimray with a 1/2" trim. Could not verify the valve size (2" or 1") of separator 1. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim.

It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

A Work Order request was issued to "bottom out" one oil tank; remove the oil fill line from the tank while keeping the tank connected to the VCS in order to be utilized as head space only. The accompanying Job Sheet did not confirm the tank was "bottomed out" and the Walkdown Checklist was not checked as complete to "Confirm all the items on the work request form have been completed." Additionally, the provided STEM Retrofit Walkdown Checklist, Item C13, indicates all tank fill lines are configured to enable LP separators to produce into all tanks.

Additional information is needed to clarify the inconsistent and conflicting information, thus it is unknown whether the Engineering Design Standard for properly applied.

Noble Response to Data Request:

Field verification for this facility was completed on or around 2/26/16, field verification confirmed that one tank was converted into a headspace tank (i.e. removed from liquid service but remained connected to vapor header).

LOD ID: **HERBST T5N-R64W-S27 L03**

Consent Decree Tank System Number: **1102**

**Audit Notes**

**Oil Dump Valve Size - Unknown**

Jobsheet (Final Packet, pg 20) indicates a new D-Grade LP Separator was installed onsite and ITEM A1 of the STEM Walkdown Checklist (Final Packet, pg 7) is checked "yes" indicating the oil dump trim is consistent with the Engineering Evaluation, and is therefore 1/2". There is no indication of the oil dump valve size installed in the separator onsite.

A 1" oil dump valve is used in the Engineering Evaluation, no documentation is provided to confirm this valve was/is installed on the LP separator. For the given trim size, 1/2", a 2" valve could be installed and therefore the Modeling Guideline cannot be confirmed as being strictly applied. Assuming a 2" valve size on the separator, the modeled results do not show an exceedance of the vapor control system capacity.

**Single Tank Battery**

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

## Engineering Evaluation Verification Audit

Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **HERBSTER T5N-R65W-S26 L01**

Consent Decree Tank System Number: **1612 / 1032**

### Audit Notes

The stem design confirmation form (PG 8 of FINAL PACKET pdf) states only one tank is associated with the site however two tanks are listed on the field data sheets (PGs 15 & 24 of PDF) as being associated with the site and no where on the stem work request form or job sheets does it state one tank was removed from site  
CB - The "No" response to "Is the number of Oil Tanks correct?" was changed to "Yes". See following explanation.

CB - This production pad initially included two separate production facilities. The STEM Work Request does not explicitly request the removal of an oil tank but does describe hooking up all existing wells and comingling production through one production train (Herbster). Recent satellite photos (10/14/2017) confirm the removal of one of the production trains, including the tank, and installation of a new burner.

CB - There is one contradiction between the Job Sheet and the Work Request Form and QC STEM Checkout Job sheet states PSHH was set to 60 psig. QC STEM Checkout form states it was calibrated to 70 psig. The Engineering Evaluation used the greater of the two pressures (70 psig) which, for the purposes of the evaluation, is the most conservative value. No further clarification is needed.

CB - There is no confirmation in the Job Sheet that the oil dump valve trim is 1/2". Item A1 of the STEM Retrofit Walkdown Checklist will be taken as confirmation that the trim is consistent with the evaluation.

CB - No additional information is needed for this audit checklist.

This site was selected for IR Camera Inspection based upon its system pressure group ( $\geq 186$ ,  $< 233$ )

**Audit Notes**

The Walkdown Checklist (HOWELL NELSON T4N-R64W-S32 L01\_WALKDOWN.pdf, pg. 4) did not indicate if all items on the Work Request form had been completed. Completion of the Work Request was verified through other documentation in the Final Packet.

Per the Work Request (HOWELL NELSON T4N-R64W-S32 L01\_FINAL PACKET.pdf, pg. 3) the dump valves on the LP separator were to be replaced with a 1" valve with 1/2" trim. The Job Sheet (HOWELL NELSON T4N-R64W-S32 L01\_FINAL PACKET.pdf, pg 18) confirms a 1/2" trim, but does not include a reference to replace the dump valve or confirmation of size as 1". A 2" valve was used in these calculations to be conservative. It is unknown if the modeling guideline was strictly followed for the tank system.

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

**Audit Notes**

The Work Request requested to consolidate flow lines into the HSR-Porter 9-11/HSR -Cullen 10-11 HLP Separator. This units oil dump valve is a 2" 2100 SMA. No request was made to change the dump valve size, only trim size. Could not verify the oil dump valve size (2" or 1") on the separator with the documentation provided. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim.

It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

## Engineering Evaluation Verification Audit

Consent Decree (90-5-2-1-10811) - 1:15-cv-00841 RBJ

LOD ID: **HSR CUTLER METZ SELLS UPRC T4N-R65W-S31 L01**

Consent Decree Tank System Number: **165**

### Audit Notes

A new HLP separator was brought on-site. Could not verify the oil dump valve size (2" or 1") of the new HLP separator. Conservatively assumed the valve to be 2", the largest available size for 1/2" trim. It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

The tank system consists of a single oil tank. The signed eval states that the certification max is 90% of the tank height and the control method is "Equalizer Height." A single tank battery does not have an equalizer line. Zero headspace surge capacity was used for this analysis and the Engineering Design Standard has not been strictly applied.

Consent Decree Tank System Number: **176**

**Audit Notes**

**Diameter of VOC Lines**

Field Datasheet (Final Packet, pg 13) show an existing 3" VOC from the tanks to the knockout.

The Job Sheet (Final Packet, pg 22) indicates a new 4" VOC above ground line was installed from the knockout to the burner. The Engineering Evaluation uses a 3" VOC line from the knockout to the burner. A larger VOC line onsite vs that which was used in the Engineering Evaluation results in an underestimation of control system capacity and therefore the Engineering Design Standard is considered strictly applied.

**Oil Dump Valve and Trim Size**

Pg 24 of the Final Packet indicates separator (SN: KM696C) was converted to a LP separator onsite. Field Datasheet (Final Packet, pg 15) shows that separator (SN: KM696C) originally had a 1" oil dump valve with a 1" trim.

No documentation is provided which indicates the 1" oil dump valve was replaced, therefore the 1" dump valve is considered currently installed on the separator. Item A1 of the STEM Walkdown Checklist is checked "yes" indicating the oil dump trim size is consistent with the Engineering Evaluation and therefore the oil dump trim size installed is 1/2".

**Audit Notes**

**1. Facility walkdown inconsistencies**

The Signed Walkdown (Final Packet, pg 28) indicates the tanks are banked onsite. The Site Sketch (Final Packet, pg 12) shows the tanks onsite are not banked. This appears to be a misunderstanding of "tank banking".

**2. Oil dump valve and trim size**

The Field Datasheet (Final Packet, pg 15) indicates that the existing HLP separator which remains onsite originally had a 2" oil dump valve with unknown trim size. The STEM Work Request (Final Packet, pg 3) indicates a 1" valve with a 3/8" trim was to be installed for oil dump. The Job Sheet (Final Packet, pg 22) did not mention the valve was changed. However, Item A1 of the walkdown checklist (Final Packet, pg 7) indicates the correct trim size was installed and question 1 of the walkdown checklist (Final Packet, pg 28) indicates all items in the work request were completed and serves as verification of the modified valve and trim sizes are installed onsite.

**3. Field Datasheets**

The Field Datasheets (Final Packet pg 12-17) are not dated. Assumed the date is the same as Facility Scouting date (2/22/2016).

LOD ID: **HSR KIRKHAM TUDOR T4N-R65W-S31 L01**

Consent Decree Tank System Number: **2134**

**Audit Notes**

**1. Field Datasheets**

The Field Datasheets (Final Packet, pg 21-27) are not dated. Assumed the date is the same as Facility Scouting date (4/21/2016).

**2. LP oil dump valve size not provided**

According to the job sheet (Final Packet, pg 35) a new LP separator was installed on site. No verification of the oil dump valve size was observed. The standard HP & LP separator design P&ID (Final Packet, pg 13) shows a 2" LP oil dump valve, whereas a 1" valve was used in the engineering evaluation.

Item A1 of the facility walkdown checklist (Final Packet, pg 7) confirms a 1/2" trim size. Use of the 2" valve in the engineering design does not result in an exceedence of the VCS design capacity.

**Audit Notes**

A new LP separator was brought on-site to develop a HP-LP train. Could not verify the valve size (2" or 1") of the new D-grade 300# LP separator. Conservatively assumed the valve to be 2", the larger available size for 1/2" trim.

It is unknown whether the Modeling Guidance was correctly applied with an unconfirmed valve body size.

LOD ID: **HUNT T8N-R60W-S19 L01**

Consent Decree Tank System Number: **2041**

**Audit Notes**

The stem work request form (PG 3 of FINAL PACKET pdf) states two tanks were to be bottomed out and used for headspace however nowhere in the job sheets (PGs 21 through 24 of FINAL PACKET pdf) does it confirm this task was completed.

The final walk-down checklist also states that the tank fill lines from the LP separator can produce into all tanks (pg.7 C13)

**NOBLE RESPONSE:**

Field verification for this facility was completed on or around 4/25/2016, field verification confirmed that two tanks were bottomed out and are used as headspace.
